1.0 Background

Bangladesh is vulnerable to both disasters and climate change and ranked the seventh extreme disaster risk-prone country in the world as per the report from the Global Climate Risk Index 2021. Most development projects in the country address reducing vulnerability to disasters or poverty, and it is well recorded how local people have their own well established coping capacities. Tropical cyclones, tornadoes, floods, coastal and riverbank erosion, droughts, landslides are the major climate-induced hazards in Bangladesh.

The Local Government Initiative on Climate Change (LoGIC) Project with the assistance of United Nations Development Program (UNDP) is planning to establish a mapping system for climate vulnerability index (CVI) in Bangladesh up to the union level. This CVI mapping will be helpful in formulating budgetary provision for the annual development plan up to the union level administration. In addition, the CVI map data can easily identify the overall pattern of climate vulnerability in different corners of this country from rural to urban settings. Most of the LGIs are unable to continue their development programs since they spend almost all the development budget to cope with the climate-induced disasters. Therefore, an annual development budgetary provision in consideration to climate-induced disasters should be crucial in the development strategy.

Vulnerability encompasses a variety of concepts including sensitivity or susceptibility to harm and lack of capacity to cope and adapt. Addressing vulnerability to climate change is the major challenge to sustainable development in the 21st century. Therefore, it is important to include vulnerability assessments in the context of multiple stressors, vulnerability mapping, and local-level studies across the country. In Bangladesh, there are a few studies on vulnerability assessment at large scales, mainly for districts and sub-districts (upazila) with equal vulnerability component weights. ADB developed CVI mapping for Bangladesh for the district level, while GIZ conducted almost the same work for the upazila level. However, there is no CVI mapping up to the union level across the country. Therefore, it is the intention of the Local Government Division to produce CVI mapping up to the lower administrative tier e.g., Local Government Institutions (LGI) as well as Pouroshava (Municipality), and City Corporations.

The Government of Bangladesh is giving priority to the grassroot level development through LGI. Therefore, the CVI map data will be helpful in assessing budgetary provision as well as formulation of policies for

improving the socioeconomic conditions of the people of this country. High vulnerability areas can be identified and interpreted as areas/unions that should be prioritized for infrastructural development, adaptation, or maintenance. This will help GOB to develop a national level database regarding climate-induced hazard exposer and sensitivity as well as adaptive capacity. Policy makers and development partners can utilize this database for achieving different Sustainable Development Goals.

2.0 Climate Vulnerability and Bangladesh

Vulnerability, in general can be defined as the inability to resist the effects of a hostile environment from external stressors (Ciurean et al., 2013). It is the “capacity to suffer harm and react adversely” according to Kates (1995), while Mitchell (1989) defined vulnerability as the “potential for loss”. Vulnerability represents the physical, economic, social susceptibility of a community to damage from threatening circumstances of natural or anthropogenic origin (Emrich and Cutter, 2011).

The concept of vulnerability has been applied in different ways by different organizations such as the Intergovernmental Panel on Climate Change (IPCC), United Nations Development Program (UNDP), Organization for Economic Cooperation and Development (OECD), the Red Cross, and others. The term “vulnerability” in the Fourth Assessment Report (AR4) is used to refer to the vulnerable system itself (e.g., low-lying islands or coastal cities) and the impact to this system (e.g., flooding of coastal cities and agricultural lands) (Schneider et al., 2007). The IPCC framework approach includes exposure, sensitivity, and adaptive capacity as the three major factors of vulnerability (Sisay 2016). In 2007, IPCC defines vulnerability as:

“The degree to which geophysical, biological and socio-economic systems are susceptible to, and unable to cope with, adverse impacts of climate change, including climate variability and extremes” (IPCC 2007, p.783).”

Vulnerability, in the context of climate change, is the degree to which a system is unable to manage the harmful effects deriving from climate and environmental stress (Macchi et al. 2011). One important dimension of vulnerability is the physical risks that result from climate stresses and these stresses are likely to include increased temperature, changing pattern of precipitation, and changes in frequency and intensity of extreme events.

Changes in climate trends with variability and extreme events in Bangladesh including temperature increase, increase of annual mean rainfall, frequent severe floods, intensity of cyclones, frequency of monsoon depressions, salinity in coastal areas are the priority issues in the development aspects of this country. Moreover, the pattern of sea-level rise is one of the foremost natural events. The current situation of sea-level rise predicted that by the mid of this century, this country could lose nearly one-fifth of its land (Lázár et al., 2020; Steckler et al., 2021) and nearly a million (De Lellis et al., 2021) coastal people would be displaced due to the present rate of sea level rise. The figure could be increased to nearly five million by the end of this century (Bell et al., 2021).

3.0 Goal and Objectives

The main goal of the study is to prepare Climate Vulnerability Index (CVI) and mapping up to the lowest tiers of Local Government Institutions (LGI) level (e.g., Union, Pouroshava, and City Corporation).

In order to achieve the goal, a number of objectives were designed. They are:

- (a) To develop a climate vulnerability index methodology based on climate and other disaster-related data as well as secondary attribute data (social, environmental, economic).
- (b) To justify downscaling the climatic data at district and sub-district levels.
- (c) To analyze the CVI following the climatic events, exposure, sensitivity, and adaptive capacity up to the union, upazila, and district levels; and
- (d) To map the CVI to figure out areas with high vulnerability and low vulnerability zones.

4.0 Data and Methods

The design for this study was composed mainly of problem formulation, relevant available data, data analysis and interpretation, as well as performing geospatial analyses with a GIS output for CVI mapping. The relevant spatial and attribute data were mainly collected from the secondary sources as well as grey literature. There are three different types of data: (a) exposure e.g., climatic data with atmospheric hazards, land-sea hazards, and surface elevation; (b) sensitivity e.g., demography, household, infrastructure, livelihood, and hydrology; and

Climate Vulnerability Index (CVI)

(c) adaptive capacity e.g., education, employment, road network, disaster response, and so on. Figure 1 shows the flow diagram for conducting CVI analysis and mapping.

The relevant spatial land-base and facility-based information were utilized for CVI mapping. Boundary information with different administrative units were collected from different secondary sources, e.g., Survey of Bangladesh (SoB), Bangladesh Bureau of Statistics (BBS), Local Government Engineering Department (LGED), Local Government Division (LGD), and Centre for Environmental GIS (CEGIS). The geophysical information, soil classification, digital elevation with topography, arable lands, hydrological data, cyclone shelters in coastal areas and more are required for this study. They were collected from BBS, SoB, Department of Agricultural Extension (DAE), Soil Resource Development Institution (SRDI), Water Resource Planning Organization (WARPO), Bangladesh Water Development Board (BWDB), and so on. Moreover, topographic map and satellite imageries were utilized for this study.

Exposure Data. The climatic data in terms of average monthly minimum temperature, average monthly maximum temperature, and average monthly precipitation were collected from Bangladesh Meteorological Department (BMD). This BMD data was based on 30 years (1991 to 2020) information. In addition, the atmospheric hazard data, in terms of floods, flash-flood, drought intensity, storm surge, and cyclones were collected from BMD, Bangladesh Country Almanac (BCA), CEGIS, LGED; and Banglapedia – the National Encyclopedia of Bangladesh. Moreover, land-sea hazards include riverbank erosion, shoreline erosion, shoreline accretion, soil salinity, groundwater salinity, sea level rise and so on. This land-sea

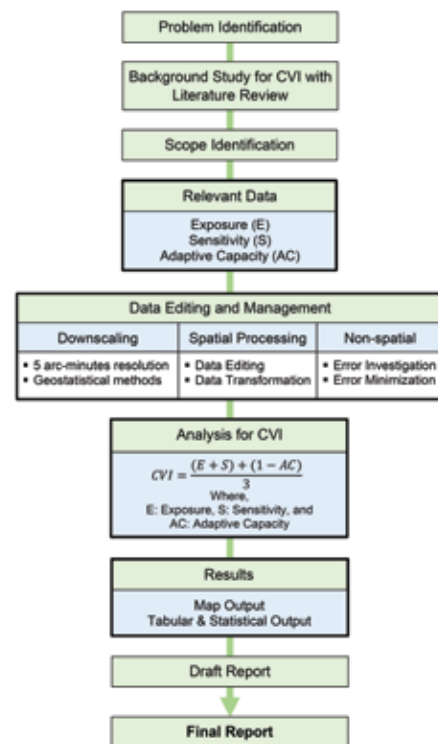

Figure 1
A schematic flow diagram for conducting the CVI mapping

Climate Vulnerability Index (CVI)

hazard data were collected from Bangladesh Country Almanac (BCA), LGED, CEGIS.

Sensitivity Data. For sensitivity analysis, it is vital to consider several relevant attribute information. In the aspect, we considered several parameters, and they are based on the six priorities in the context of Bangladesh. They are demographic characteristics, household pattern, livelihood and employment (agriculture, fisheries, livestock, small cottage, industries, education, and other primary, secondary, and tertiary economic activities, connectivity (road, river, and rail transportation), water supply, sanitation and hygiene (WASH) characteristics, and access to health. All these information were collected from BBS, BWDB, DAE, Department of Public Health Engineering (DPHE), LGED, SRDI, WARPO, and so on.

Adaptive Capacity. Information about adaptive capacity (AC) were utilised to complete the CVI analysis. The AC information include level of education, employment, household pattern, basic facilities, food security, social network, and disaster response. All the information about the above mentioned indicators were collected from BBS; BCA; CPP; DAE; Department of Disaster Management (DDM); DPHE; FFWC; LGED; Power Division and Energy and Mineral Resources Division (EMRD) under the Ministry of Power, Energy and Mineral Resources (MPEMR); SPARRSO, and so on.

Climate Data Downscaling. Collecting climatic data from 1991 to 2020 from 35 meteorological stations across the country, it was downscaled to 5 arc-minutes (10km x 10km) of spatial resolution to meet the climatic situation at LGI level (Figure 2). Downscaling of the BMD provided climate data was analysed through Inverse Distance Weighted (IDW) method with spherical model from ArcGIS (Licensed version 10.8.2) for union-level distribution. The IDW interpolator is a point estimation technique based on the weighting of a random function for a particular cell node of a grid (Serón et al, 2001). The IDW interpolator assumes that each input point has a local influence that diminishes with distance. It weights the points closer to the processing cell greater than those further away, hence the name IDW interpolation or Inverse Squared Distance (ISD) interpolation (Isaaks and Srivastava, 1989). The average monthly minimum temperature, the average monthly maximum temperature, and average monthly rainfall were downscaled.

It was considered several aspects and assumptions for climate downscaling. The following steps were considered to accomplish the task:

Climate Vulnerability Index (CVI)

- Gathering of baseline data (current climates corresponding to BMD).
- Gathering of full BMD data timeseries.
- Calculation of 30 year running averages for present day simulations (1991-2020).
- There are a total of 35 meteorological stations in Bangladesh. With 5 arc-minutes of spatial resolution, there were 1944 cells for climatic grids within Bangladesh for downscaling (Figure 2).

Figure 2

Selected cells or meteorological stations for downscaling the climate data: (a) 35 meteorological stations; (b) Bangladesh and surrounding areas with grid cells; and (c) grid cells within Bangladesh. There are a total of 1944 cells across the country.

Calculation of CVI. Since the CVI is expressed with the function of exposure (E), sensitivity (S), and adaptive capacity (AC), it was calculated with the given formula option:

$$CVI = \frac{(E + S) + (1 - AC)}{3}$$

In calculating the CVI, it was considered to categorise the indicator classes of exposure, sensitivity and adaptive capacity with the weighted value ranging from “0” to “1”. The selected categories were very low (≤ 0.20), low (0.20-0.40), moderate (0.40-0.60), high (0.60-0.80), and very high (≥ 0.80). After analysing the CVI for each LGI, the CVI mapping was prepared with ArcGIS software.

5.0 Results

The calculated CVI for different administrative units in Bangladesh is presented in Table 1. Apart from LGI level CVI, Annex 1 shows the distribution of district level CVI. For district level CVI mapping, 7 districts were within the very low category followed by 17 in the low category, 19 in both the moderate and high categories; while severe category contains

Climate Vulnerability Index (CVI)

only 2 districts in Bangladesh, and they are Patuakhali district (0.569) and Bandarban district (0.552). The figure shows that Munshiganj district (0.408) and Narayanganj (0.416) are the areas with very low CVI category (Figure 3).

Table 1
CVI frequencies of different administrative units in Bangladesh

Categories	CVI Frequencies		
	District	Upazila	Union
Very Low	7 (10.9%)	31 (6.7%)	586 (12.2%)
Low	17 (26.6%)	64 (13.8%)	1291 (26.9%)
Moderate	18 (28.1%)	136 (29.4)	1174 (24.5%)
High	20 (31.3%)	112 (24.2%)	1189 (24.8%)
Very High	2 (3.1%)	120 (25.9%)	552 (11.5%)
Total:	64	463	4792

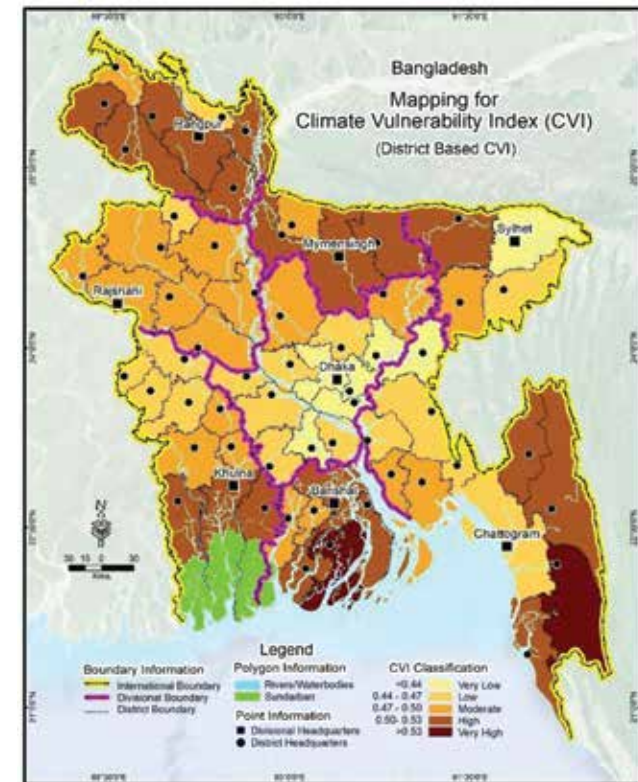

Figure 3

CVI mapping in different districts in Bangladesh

Climate Vulnerability Index (CVI)

In case of Upazila level CVI mapping, 31 upazila (6.7%) of the total upazila are within the very low category, 64 (13.8%) upazila are within the low category, 136 (29.4%) are within moderate category, 112 (24.2%) are in high category, and 120 (25.9%) are within the very high or severe CVI category (Annex 2). Akhaura upazila (0.38) from Brahmanbaria district is the lowest in very low category of vulnerability, while Kahaloo upazila (0.68) from Bogura district is the most vulnerable area in Bangladesh (Figure 4).

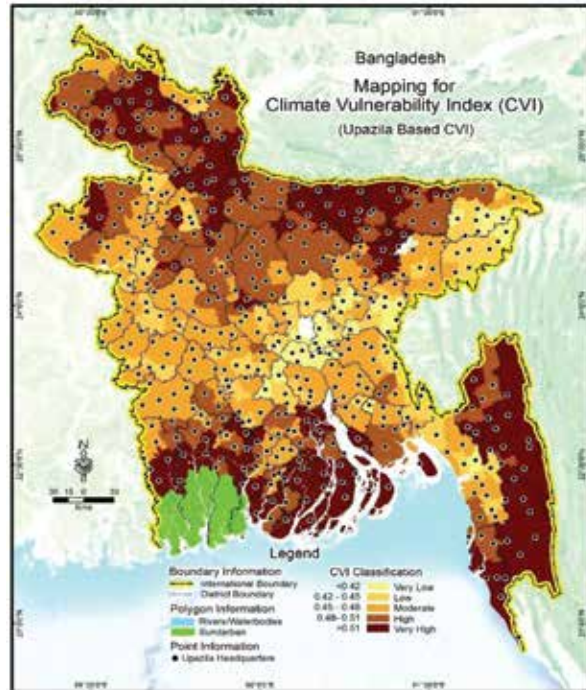

Figure 4

CVI mapping in different upazilas in Bangladesh

The main objective of this was CVI mapping of LGIs. Accordingly, the CVI was analysed at the union level and visualized into map. Some 586 (12.2%) unions were classified as the very low category of CVI followed by 1291 (26.9%) unions are within the low category, 1174 (24.5%) are in moderate category, and 1189 (24.8%) are within the high category. It is noted that some 552 (11.5%) unions are within the severe category.

In case of Union level CVI mapping, Annex 3 showing the distribution of union level CVI from highest vulnerability to lowest vulnerability is given in google drive link below:

Climate Vulnerability Index (CVI)

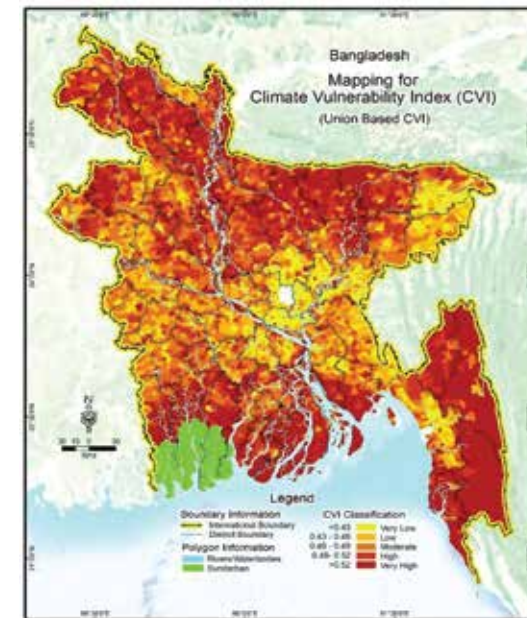

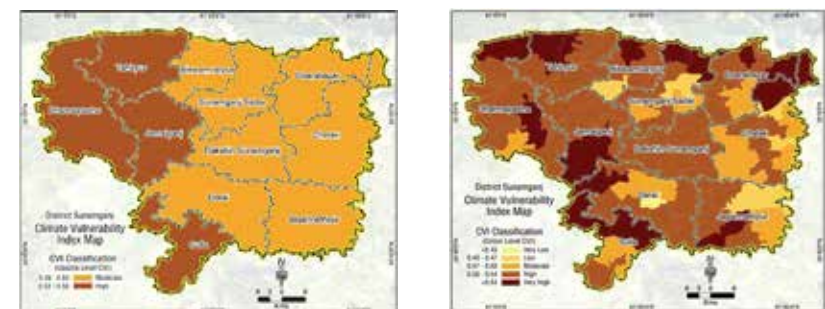

Figure 5

CVI mapping in different unions in Bangladesh

Sonarang Tongibari union (0.339) from Munshiganj district is the area where vulnerability is very low; while Gabura union (0.647) and Kaikhali union (0.634) from Satkhira district, Chhoto Baisdia (0.639) and Lahua union (0.637) from Patuakhali district are the most vulnerable areas in Bangladesh (Figure 3c). In addition, Figure 6 and 7 show the spatial distribution pattern of CVI at the upazila and union levels in Sunamganj district. This figure clearly shows the pattern of CVI distribution in both the upazila and union level administrative units in Sunamganj district.

Distribution of Union level CVI for Sunamganj District

6.0 Recommendations

6.1 Short-term Initiatives

- A proper SOP is required for utilizing this report for disaster prevention, preparedness, response, and recovery.
- Awareness campaign (training, workshop, leaflet distribution, meetings, etc.) on Climate Vulnerability and coping and adaptive strategy should be arranged regularly. LGD can take the lead with technical assistance from LoGIC in this aspect.
- Inter-ministerial coordination is prerequisite for disaster risk reduction with potential measures using CVI.
- Initiatives from LoGIC may be taken for sensitizing LGD officials using CVI in case of planning and allocation of fund to LGI.

6.2 Long-term Initiatives

- LGD should endorse CVI data in fund allocation (ADP) criteria in addition to existing formula based on population, area and backwardness.
- The IEC materials should be prepared with complete instructions following different steps of disaster prevention, preparedness, response, and recovery.
- LGD may issue directions to LGI for taking climate vulnerability into consideration in case of local level planning and budgeting.
