

ISSUE  
BRIEF

# CHINA IN NUMBERS

## (2023)

*This issue brief summarises the main data points relating to China's economy, people-related metrics, energy, and CO<sub>2</sub> emissions.*

*The aim of this issue brief is to reflect the current condition of China's economy and society, whilst providing a comprehensive view of the trends that have emerged over time.*

*The views expressed in this publication are those of the authors and do not necessarily reflect the views or policies of the United Nations (UN) and the United Nations Development Programme (UNDP).*

March 2024

# 1. The Economy

## 1.1 Economic Growth

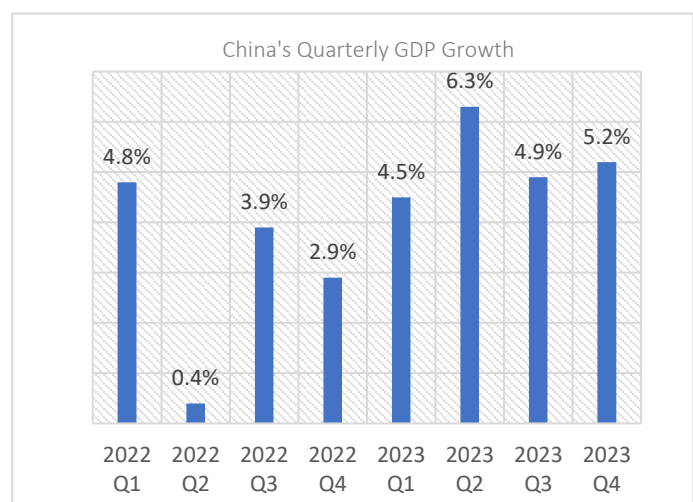

As China eased its COVID-19 control measures and reopened its borders in December 2022, the economy **began to gradually recover from its 3% growth slowdown in 2022**. In 2023, the country's GDP grew by 5.2% in real terms, reaching RMB 126.06 trillion (US\$17.5 trillion). This was in line with the Government's **target of "around 5%"** set at the beginning of the year.

China's 2023 growth rate is likely to have marginally exceeded the regional average, with East Asia and the Pacific (excluding high-income countries) expecting to have recorded a growth rate of 5.1% in 2023.<sup>1</sup>

Throughout 2023, China's economic growth remained above 4.5% across four quarters. The second quarter saw the strongest performance, primarily due to the base effect.

The economic outlook, however, still carries some uncertainty due to various challenges faced by the economy. These challenges include a weakened property sector and softer global and domestic demand. According to the latest estimates released by the International Monetary Fund (IMF) in January, China's growth is projected to slow down to 4.6% in 2024.

<sup>1</sup><https://thedocs.worldbank.org/en/doc/661f109500bf58fa36a4a46eeace6786-0050012024/related/GEP-Jan-2024-Analysis-EAP.pdf> East Asia and the Pacific includes the following countries: Cambodia, China, Indonesia, Korea, Lao PDR, Malaysia, Mongolia, Myanmar, Pacific Islands, Papua New Guinea, Philippines, Singapore, Thailand, Timor-Leste, Viet Nam.

As the economy recovered, the **contributions of the three key sectors** – primary, secondary, and tertiary industries to GDP growth returned to pre-pandemic levels. Particularly **noteworthy is the service sector**, which has greatly benefited from the lifting of COVID-19 preventive measures. The contribution of **services to GDP rose from 55.3% in 2022 to 60.2% in 2023**. Meanwhile, the contribution of the primary industry dropped to 5.9%.

In 2023, the **real estate sector's share of GDP continued to decline**, reaching 5.8% from its peak level of 7.3% in 2020. By contrast, the construction sector remained relatively stable, hovering around 6.8%. Given the growing concerns over the property market, China has taken a series of measures to support both sectors, including adjusting mortgage lending-related policies and easing restrictions on buying homes.<sup>2</sup>

<sup>2</sup> <https://www.chinadaily.com.cn/a/202310/11/WS6526044ba31090682a5e7e1d.html>

In 2023, **domestic demand emerged as the dominant driver** of China's economy, contributing **82.5%** of its GDP growth. The contribution of **investment decreased to pre-COVID levels at 28.9%**. Meanwhile, net exports exerted a downward pressure on economic performance, contributing negatively by 11.4%. This trend occurred amidst a global decline in international trade in 2023.<sup>3</sup>

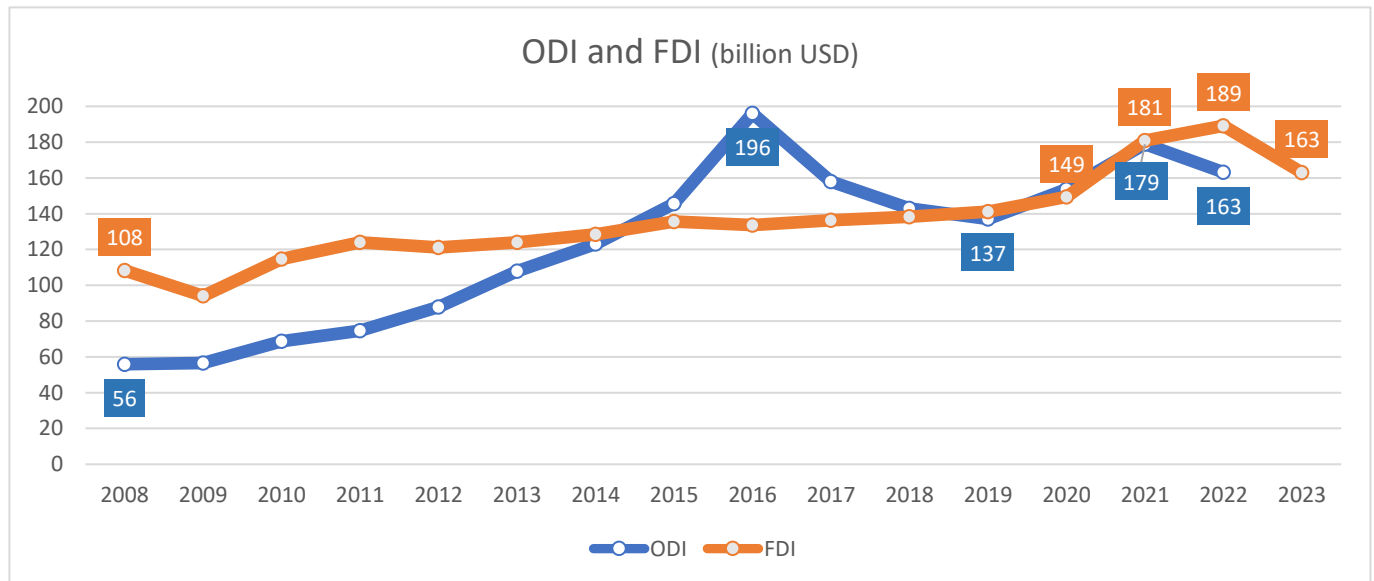

## 1.2 International Trade and Investment Flow

**In 2023, China's trade stagnated**, with the total value of imports and exports remaining around 41.8 trillion RMB. While there was a slight increase in exports, imports declined. Geographically categorising, China's trade share with the European Union (EU), the United States, Japan, and Korea decreased from a peak of **38.3% in 2020 to 35% in 2023**. In the meantime, **the Association of Southeast Asian Nations (ASEAN)** vaulted to and remained China's biggest trading partner, as it has been since 2020.

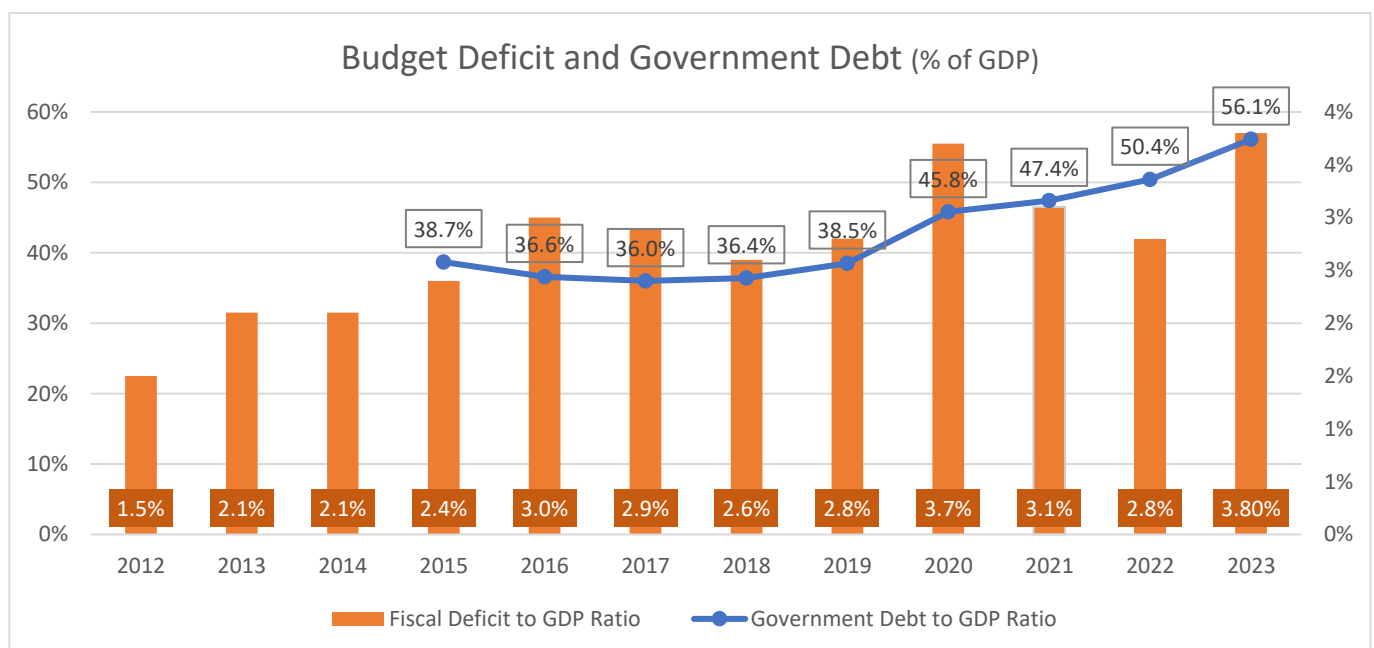

<sup>3</sup> <https://unctad.org/system/files/official-document/ditcinf2023d3.pdf>

In 2023, China witnessed a **decline in foreign direct investment (FDI)**, marking the **first decrease** since the 2008 global financial crisis. Additionally, outbound direct investment (ODI) decreased by 6% to US\$163 billion in 2022. Nevertheless, China retained its position as the **third-largest source of ODI globally**.<sup>4</sup>

### 1.3 Government Debt

China's **outstanding central and local government debt continued to climb**, after a significant expansion in 2020. The total of central and local government debt reached 70.77 trillion RMB by the end of 2023, **amounting to 56.1% of GDP**. Meanwhile, China's general government **budget deficit** was set to 3.8% of GDP in 2023 compared to 2.8% in 2022.

<sup>4</sup> [https://unctad.org/system/files/official-document/wir2023\\_en.pdf](https://unctad.org/system/files/official-document/wir2023_en.pdf)

## 1.4 Digital Economy

China's digital economy continued to expand robustly in 2022, topping **50.2 trillion RMB, up 10.2% year-on-year**. The digital economy's share of GDP climbed to **41.5% in 2022**.<sup>5</sup>

## 2. People

### 2.1 Human Development Index (HDI)

Amidst mounting economic challenges both domestically and globally, China continues to make positive progress in its human development. China's HDI increased to 0.788 in 2022, placing it in the **“high human development” category**. China's ranking also improved from 79 in 2021 to 75 in 2022, out of 193 countries and territories.

	Human Development Index value (HDI)	Inequality-adjusted HDI (IHDI)	Planetary pressures-adjusted Human Development Index (PHDI)
China	0.788	0.662	0.679
East Asia and the Pacific	0.766	0.640	0.683

PHDI is the level of human development adjusted to **account for the excessive human pressure on the planet**. In 2022, China's PHDI was 0.679, a loss of 13.8 percent compared to its HDI. This loss has decreased from 15.6% in 2021, but remains **higher than** the average loss due to planetary pressure observed in East Asia and the Pacific region (10.8%).

When China's **HDI is inequality-adjusted**, the index falls to 0.662, **a loss of 16%**. China's loss is **lower than** the average loss for East Asia and the Pacific (16.4%).

<sup>5</sup> The digital economy refers to an emerging economic form, where digitalised knowledge and information are taken as essential productive factors, digital technology taken as the core driver, and modern information networks taken as the key carrier.

## 2.2 Inequality

China's **Gini coefficient for income** peaked in 2008 and steadily declined until 2015. In 2022, the value rebounded to 0.467, higher than the average of 0.35 for Asia-Pacific economies.<sup>6</sup>

Over the past decade, the annual per capita disposable income in both urban and rural areas of China improved, up to 51,821 RMB and 21,691 RMB respectively in 2023. While there remains a large income disparity between urban and rural areas, it is worth noting that the gap, as measured by urban-rural income ratios, has been declining since 2013 and stood at 2.38 in 2023.

<sup>6</sup> <https://www.oecd-ilibrary.org/sites/01bc89ac-en/index.html?itemId=/content/component/01bc89ac-en>.

In addition to the income gap, there is also evidently a **digital divide between rural and urban areas**. In 2023, urban and rural internet penetration rates were at 85.1% and 60.5% respectively. While the digital divide had been steadily decreasing since 2018, a trend reversal was recorded in 2023, which rose to 24.6% from the 21.1% indicated in 2022.

### 2.3 Unemployment

In 2022, the average **surveyed unemployment rate increased to 5.6%, higher than the 5.5% target** set in the Government Work Report delivered at the start of the year. Notably, the average surveyed youth unemployment rate saw a significant rise from 14.3% in 2021 to 17.6% in 2022. By June 2023, youth unemployment hit an all-time high of 21.3%, indicating strong pressures on China’s job market.

## 2.4 Urbanisation and Migrant Workers

In the past four decades, China underwent a rapid urbanisation process. The urbanisation rate of permanent residence more than tripled since 1982, reaching 66.2% in 2023. China's rapid urbanisation has also led to a surge in **migrant workers**, with the total number reaching 295.6 million in 2022.

Looking at the demographic composition, **men comprise the majority**, accounting for 63.4% of the total migrant worker population. However, there has been an increase in the proportion of women in recent years, with their share rising from 34.8% in 2018 to 36.6% in 2022. **The average age of rural migrant workers is 42.3 years and has been steadily increasing.** Notably, the percentage of migrant workers aged 50 and above has also risen from 22.4% in 2018 to nearly 30% in 2022.

## 2.5 Ageing Population

China is one of the fastest ageing countries in the world. It currently has 216.8 million people aged 65 years or older, accounting for 15.4% of the population. China's natural population growth rate fell drastically from 6.53% in 2016 to -1.48% in 2023. This marks a turning point for China's demographic trends with implications for its labour markets and consumption patterns.

## 3. Energy and CO<sub>2</sub> Emissions

### 3.1 Primary Energy Production

As the largest energy producer in the world, China's primary energy production reached 4.66 billion tons of standard coal equivalent (BtSCE) in 2022, an increase of 7.6% year-on-year. The latest data on energy production composition shows that coal (69.2%) leads, followed by crude oil (6.3%), gas (6%) and non-fossil energy resources (18.6%).

### 3.2 Energy Consumption

China's **total energy consumption reached 5.41 BtSCE in 2022**, a 3.2% year-on-year increase from last year. While coal (56.2%) remains dominant, the share of non-fossil energy (hydropower, nuclear, wind and solar power) has shown an upward trend, rising from 16.6% in 2021 to 17.4% in 2022. As a reference, China's latest Nationally Determined Contribution (NDC) target is to increase the share of non-fossil fuels in primary energy consumption to 25%.

### 3.3 Installed Electricity Capacity

In terms of installed electricity capacity, the share of non-fossil electricity has steadily increased in the last decade. In June 2023, this ratio reached 50.9%, achieving a significant milestone two years ahead of target. This trend is mainly driven by the rapid rise in installed electricity capacity from wind and solar as depicted below.

### 3.4 CO<sub>2</sub> Emissions

In 2022, China's **total CO<sub>2</sub> emissions were estimated to be 12.14 GtCO<sub>2</sub>/year**, lower than its emissions in 2021, which stand at 12.22 GtCO<sub>2</sub>/year. In 2022, 67.3% of China's CO<sub>2</sub> emissions came from coal (steaming<sup>7</sup> and coke<sup>8</sup>), 19.6% from oil, 7.1% from cement and 5.9% from gas.<sup>9</sup>
