

Human Development Report 2020

The Next Frontier: Human Development and the Anthropocene

Briefing note for countries on the 2020 Human Development Report

Ghana

Introduction

This year marks the 30th Anniversary of the first Human Development Report and of the introduction of the Human Development Index (HDI). The HDI was published to steer discussions about development progress away from GDP towards a measure that genuinely “counts” for people’s lives.

Introduced by the Human Development Report Office (HDRO) thirty years ago to provide a simple measure of human progress – built around people’s freedoms to live the lives they want to - the HDI has gained popularity with its simple yet comprehensive formula that assesses a population’s average longevity, education, and income. Over the years, however, there has been a growing interest in providing a more comprehensive set of measurements that capture other critical dimensions of human development.

To respond to this call, new measures of aspects of human development were introduced to complement the HDI and capture some of the “missing dimensions” of development such as poverty, inequality and gender gaps. Since 2010, HDRO has published the Inequality-adjusted HDI, which adjusts a nation’s HDI value for inequality within each of its components (life expectancy, education and income) and the Multidimensional Poverty Index that measures people’s deprivations directly. Similarly, HDRO’s efforts to measure gender inequalities began in the 1995 Human Development Report on gender, and recent reports have included two indices on gender, one accounting for differences between men and women in the HDI dimensions, the other a composite of inequalities in empowerment and well-being.

This briefing note is organized into seven sections. The first section presents information on the country coverage and methodology for the 2020 Human Development Report. The next six sections provide information about key composite indices of human development:

- the HDI, the Inequality-adjusted Human Development Index (IHDI),
- the Gender Development Index (GDI),
- the Gender Inequality Index (GII),
- the Multidimensional Poverty Index (MPI), and
- the Planetary pressures-adjusted HDI (PHDI).

The tables presented in this note depict the state of human development before the COVID-19 pandemic based on available data for 2019 and earlier years. Data reflecting changes caused by the COVID-19 pandemic and its socioeconomic fallout

in 2020 will be available in 2021 and will be presented in tables and related analyses of the 2021 Human Development Report.

It is important to note that national and international data can differ because international agencies standardize national data to allow comparability across countries and in some cases may not have access to the most recent national data.

1- Country coverage and the methodology of the 2020 Human Development Report

The 2020 Human Development Report presents the 2019 HDI (values and ranks) for 189 countries and UN-recognized territories, along with the IHDI for 152 countries, the GDI for 167 countries, the GII for 162 countries, and the MPI for 107 countries¹.

It is misleading to compare values and rankings with those of previously published reports, because of revisions and updates of the underlying data and adjustments to goalposts. Readers are advised to assess progress in HDI values by referring to Table 2 ('Human Development Index Trends') in the 2020 Human Development Report. Table 2 is based on consistent indicators, methodology and time-series data and, thus, shows real changes in values and ranks over time, reflecting the actual progress countries have made. Small changes in values should be interpreted with caution as they may not be statistically significant due to sampling variation. Generally speaking, changes at the level of the third decimal place in any of the composite indices are considered insignificant.

Unless otherwise specified in the source, tables use data available to HDRO as of 15 July 2020. All indices and indicators, along with technical notes on the calculation of composite indices, and additional source information are available online at <http://hdr.undp.org/en/data>

For further details on how each index is calculated please refer to *Technical Notes 1-6* and the associated background papers available on the Human Development Report website: <http://hdr.undp.org/en/data>

2- Human Development Index (HDI)

The HDI is a summary measure for assessing long-term progress in three basic dimensions of human development: a long and healthy life, access to knowledge and a decent standard of living. A long and healthy life is measured by life expectancy. Knowledge level is measured by mean years of schooling among the adult population, which is the average number of years of schooling received in a life-time by people aged 25 years and older; and access to learning and knowledge by expected years of schooling for children of school-entry age, which is the total number of years of schooling a child of school-entry age can expect to receive if prevailing patterns of age-specific enrolment rates stay the same throughout the child's life. Standard of living is measured by Gross National Income (GNI) per capita expressed in constant 2017 international dollars converted using purchasing power parity (PPP) conversion rates. For more details see Technical Note 1.

¹ Throughout this note, the term country refers to countries or UN-recognized territories

To ensure as much cross-country comparability as possible, the HDI is based primarily on international data from the United Nations Population Division (the life expectancy data), the United Nations Educational, Scientific and Cultural Organization Institute for Statistics (the mean years of schooling and expected years of schooling data) and the World Bank (the GNI per capita data). As stated in the introduction, the HDI values and ranks in this year's report are not comparable to those in past reports because of some revisions to the component indicators. To allow for assessment of progress in HDIs, the 2020 Human Development Report includes recalculated HDIs from 1990 to 2019 using consistent series of data.

2.1- Ghana's HDI value and rank

Ghana's HDI value for 2019 is 0.611— which put the country in the medium human development category—positioning it at 138 out of 189 countries and territories. The rank is shared with Eswatini (Kingdom of).

Between 1990 and 2019, Ghana's HDI value increased from 0.465 to 0.611, an increase of 31.4 percent. Table A reviews Ghana's progress in each of the HDI indicators. Between 1990 and 2019, Ghana's life expectancy at birth increased by 7.3 years, mean years of schooling increased by 2.4 years and expected years of schooling increased by 3.9 years. Ghana's GNI per capita increased by about 127.6 percent between 1990 and 2019.

Table A: Ghana's HDI trends based on consistent time series data and new goalposts

Year	Life expectancy at birth	Expected years of schooling	Mean years of schooling	GNI per capita (2017 PPP\$)	HDI value
1990	56.8	7.6	4.9	2,315	0.465
1995	57.5	7.7	5.7	2,471	0.483
2000	57.0	8.0	6.1	2,682	0.494
2005	58.7	8.7	6.4	3,111	0.520
2010	61.0	10.9	6.7	3,676	0.565
2015	62.8	11.1	6.9	4,614	0.590
2016	63.1	11.6	7.1	4,638	0.598
2017	63.5	11.5	7.1	4,864	0.602
2018	63.8	11.5	7.2	5,057	0.606
2019	64.1	11.5	7.3	5,269	0.611

Figure 1 shows the contribution of each component index to Ghana's HDI since 1990.

Figure 1: Trends in Ghana's HDI component indices 1990-2019

2.2- Assessing progress relative to other countries

Human development progress, as measured by the HDI, is useful for comparison between two or more countries. For instance, during the period between 1990 and 2019 Ghana, Zimbabwe and Sao Tome and Principe experienced different degrees of progress toward increasing their HDIs (see Figure 2).

Figure 2: HDI trends for Ghana, Zimbabwe and Sao Tome and Principe, 1990-2019

Ghana's 2019 HDI of 0.611 is below the average of 0.631 for countries in the medium human development group and above the average of 0.547 for countries in Sub-Saharan Africa. From Sub-Saharan Africa, Ghana is compared with Cameroon and Kenya, which have HDIs ranked 153 and 143, respectively (see Table B).

Table B: Ghana's HDI and component indicators for 2019 relative to selected countries and groups

	HDI value	HDI rank	Life expectancy at birth	Expected years of schooling	Mean years of schooling	GNI per capita (2017 PPP US\$)
Ghana	0.611	138	64.1	11.5	7.3	5,269
Cameroon	0.563	153	59.3	12.1	6.3	3,581
Kenya	0.601	143	66.7	11.3	6.6	4,244
Sub-Saharan Africa	0.547	—	61.5	10.1	5.8	3,686
Medium HDI	0.631	—	69.3	11.5	6.3	6,153

3- Inequality-adjusted HDI (IHDI)

The HDI is an average measure of basic human development achievements in a country. Like all averages, the HDI masks inequality in the distribution of human development across the population at the country level. The 2010 Human Development Report introduced the IHDI, which takes into account inequality in all three dimensions of the HDI by 'discounting' each dimension's average value according to its level of inequality. The IHDI is basically the HDI discounted for inequalities. The 'loss' in human development due to inequality is given by the difference between the HDI and the IHDI, and can be expressed as a percentage. As the inequality in a country increases, the loss in human development also increases.

We also present the coefficient of human inequality as a direct measure of inequality which is an unweighted average of inequalities in three dimensions. The IHDI is calculated for 152 countries. For more details see Technical Note 2.

Ghana's HDI for 2019 is 0.611. However, when the value is discounted for inequality, the HDI falls to 0.440, a loss of 28.0 percent due to inequality in the distribution of the HDI dimension indices. Cameroon and Kenya show losses due to inequality of 33.4 percent and 26.3 percent, respectively. The average loss due to inequality for medium HDI countries is 26.3 percent and for Sub-Saharan Africa it is 30.5 percent. The Human inequality coefficient for Ghana is equal to 27.8 percent (see Table C).

Table C: Ghana's IHDI for 2019 relative to selected countries and groups

	IHDI value	Overall loss (%)	Human inequality coefficient (%)	Inequality in life expectancy at birth (%)	Inequality in education (%)	Inequality in income (%)
Ghana	0.440	28.0	27.8	24.2	35.1	24.1
Cameroon	0.375	33.4	33.4	33.5	31.7	35.0
Kenya	0.443	26.3	26.2	22.5	22.9	33.1
Sub-Saharan Africa	0.380	30.5	30.5	29.7	34.1	27.6
Medium HDI	0.465	26.3	25.9	20.8	37.1	19.7

4- Gender Development Index (GDI)

In the 2014 Human Development Report, HDRO introduced a new measure, the GDI, based on the sexdisaggregated Human Development Index, defined as a ratio of the female to the male HDI. The GDI measures gender inequalities in achievement in three basic dimensions of human development: health (measured by female and male life expectancy at birth), education (measured by female and male expected years of schooling for children and mean years for adults aged 25 years and older) and command over economic resources (measured by female and male estimated GNI per capita). For details on how the index is constructed refer to Technical Note 3. Country groups are based on absolute deviation from gender parity in HDI. This means that the grouping takes into consideration inequality in favour of men or women equally.

The GDI is calculated for 167 countries. The 2019 female HDI value for Ghana is 0.582 in contrast with 0.639 for males, resulting in a GDI value of 0.911, placing it into Group 4.² In comparison, GDI values for Cameroon and Kenya are 0.864 and 0.937, respectively (see Table D).

² Countries are divided into five groups by absolute deviation from gender parity in HDI values. Group 1 comprises countries with high equality in HDI achievements between women and men (absolute deviation of less than 2.5 percent), group 2 comprises countries with medium to high equality in HDI achievements between women and men (absolute deviation of 2.5–5 percent), group 3 comprises countries with medium

Table D: Ghana's GDI for 2019 relative to selected countries and groups

	F-M ratio	HDI values		Life expectancy at birth		Expected years of schooling		Mean years of schooling		GNI per capita	
	GDI value	Female	Male	Female	Male	Female	Male	Female	Male	Female	Male
Ghana	0.911	0.582	0.639	65.2	63.0	11.4	11.6	6.6	8.1	4,073	6,432
Cameroon	0.864	0.521	0.603	60.6	58.0	11.3	12.9	4.7	8.0	2,973	4,189
Kenya	0.937	0.581	0.620	69.0	64.3	11.0	11.7	6.0	7.2	3,666	4,829
Sub Saharan Africa	0.894	0.516	0.577	63.3	59.8	9.5	10.6	4.9	6.7	2,937	4,434
Medium HDI	0.835	0.567	0.679	70.8	67.9	11.7	11.4	5.3	8.1	2,530	9,598

5- Gender Inequality Index (GII)

The 2010 Human Development Report introduced the GII, which reflects gender-based inequalities in three dimensions – reproductive health, empowerment, and economic activity. Reproductive health is measured by maternal mortality and adolescent birth rates; empowerment is measured by the share of parliamentary seats held by women and attainment in secondary and higher education by each gender; and economic activity is measured by the labour market participation rate for women and men. The GII can be interpreted as the loss in human development due to inequality between female and male achievements in the three GII dimensions. For more details on GII please see Technical Note 4.

Ghana has a GII value of 0.538, ranking it 135 out of 162 countries in the 2019 index. In Ghana, 13.1 percent of parliamentary seats are held by women, and 55.7 percent of adult women have reached at least a secondary level of education compared to 71.6 percent of their male counterparts. For every 100,000 live births, 308.0 women die from pregnancy related causes; and the adolescent birth rate is 66.6 births per 1,000 women of ages 15-19. Female participation in the labour market is 63.6 percent compared to 71.9 for men (see Table E).

In comparison, Cameroon and Kenya are ranked at 141 and 126, respectively, on this index.

Table E: Ghana's GII for 2019 relative to selected countries and groups

Female Male Female Male

	GII value	GII Rank	Maternal mortality ratio	Adolescent birth rate	Female seats in parliament (%)	Population with at least some secondary education (%)		Labour force participation rate (%)	
						Female	Male	Female	Male
Ghana	0.538	135	308.0	66.6	13.1	55.7	71.6	63.6	71.9
Cameroon	0.560	141	529.0	105.8	29.3	32.7	41.3	71.1	81.1
Kenya	0.518	126	342.0	75.1	23.3	29.8	37.3	72.1	77.3
Sub Saharan Africa	0.570	—	535.2	104.9	24.0	28.8	39.8	63.3	72.7
Medium HDI	0.501	—	161.5	34.6	20.4	30.1	46.3	28.3	77.1

Maternal mortality ratio is expressed in number of deaths per 100,000 live births and adolescent birth rate is expressed in number of births per 1,000 women ages 15-19.

equality in HDI achievements between women and men (absolute deviation of 5–7.5 percent), group 4 comprises countries with medium to low equality in HDI achievements between women and men (absolute deviation of 7.5–10 percent) and group 5 comprises countries with low equality in HDI achievements between women and men (absolute deviation from gender parity of more than 10 percent).

6- Multidimensional Poverty Index (MPI)

The 2010 Human Development Report introduced the MPI, which identifies multiple overlapping deprivations suffered by individuals in 3 dimensions: health, education and standard of living. The health and education dimensions are based on two indicators each, while standard of living is based on six indicators. All the indicators needed to construct the MPI for a country are taken from the same household survey. The indicators are weighted to create a deprivation score, and the deprivation scores are computed for each individual in the survey. A deprivation score of 33.3 percent (one-third of the weighted indicators) is used to distinguish between the poor and nonpoor. If the deprivation score is 33.3 percent or greater, the household (and everyone in it) is classified as multidimensionally poor. Individuals with a deprivation score greater than or equal to 20 percent but less than 33.3 percent are classified as vulnerable to multidimensional poverty. Finally, individuals with a deprivation score greater than or equal to 50 percent live in severe multidimensional poverty.

Since 2018, HDRO and the Oxford Poverty and Human Development Initiative jointly produce and publish the MPI estimates. The latest release from July 2020 covers 107 developing countries (countries that lack survey data that allow for the calculation of the MPI are not included): 'Charting pathways out of multidimensional poverty: Achieving the SDGs' (also available in French and Spanish). Definitions of deprivations in each indicator, as well as methodology of the MPI are given in Technical note 5. Continuing with the practice from the previous years, HDRO is making public the statistical programs used in the calculation of the 2020 MPI for a large selection of countries (see <http://hdr.undp.org/en/content/mpi-statistical-programmes>).

The most recent survey data that were publicly available for Ghana's MPI estimation refer to 2014. In Ghana, 30.1 percent of the population (8,952 thousand people) are multidimensionally poor while an additional 22.0 percent are classified as vulnerable to multidimensional poverty (6,555 thousand people). The breadth of deprivation (intensity) in Ghana, which is the average deprivation score experienced by people in multidimensional poverty, is 45.8 percent. The MPI, which is the share of the population that is multidimensionally poor, adjusted by the intensity of the deprivations, is 0.138. Cameroon and Kenya have MPIs of 0.243 and 0.178, respectively.

Table F compares multidimensional poverty with income poverty, measured by the percentage of the population living below 2011 PPP US\$1.90 per day. It shows that income poverty only tells part of the story. The multidimensional poverty headcount is 16.8 percentage points higher than income poverty. This implies that individuals living above the income poverty line may still suffer deprivations in health, education and/or standard of living. Table F also shows the percentage of Ghana's population that lives in severe multidimensional poverty. The contributions of deprivations in each dimension to overall poverty complete a comprehensive picture of people living

in multidimensional poverty in Ghana. Figures for Cameroon and Kenya are also shown in the table for comparison.

Table F: The most recent MPI for Ghana relative to selected countries

	Survey year	MPI value	Head count (%)	Intensity of deprivations (%)	Population share (%)			Contribution to overall poverty of deprivations in (%)		
					Vulnerable to multi-dimensional poverty	In severe multi-dimensional poverty	Below income poverty line	Health	Education	Standard of living
Ghana	2014	0.138	30.1	45.8	22.0	10.4	13.3	22.3	30.4	47.2
Cameroon	2014	0.243	45.3	53.5	17.3	25.6	23.8	23.2	28.2	48.6
Kenya	2014	0.178	38.7	46.0	34.9	13.3	36.8	24.9	14.6	60.5
Sub-Saharan Africa	-	0.299	55.0	54.3	17.9	32.9	45.7	22.4	29.3	48.4

7- Planetary pressures–adjusted HDI (PHDI)

Planetary pressures–adjusted HDI (PHDI): HDI value adjusted by the level of carbon dioxide emissions and material footprint per capita to account for excessive human pressures on the planet. It should be seen as an incentive for transformation. See Technical note at http://hdr.undp.org/sites/default/files/phdi_tn.pdf for details on how the PHDI is calculated.

Difference from HDI value: Percentage difference between the PHDI value and the HDI value.

Difference from HDI rank: Difference in ranks on the PHDI and the HDI, calculated only for countries for which a PHDI value is calculated.

Adjustment factor for planetary pressures: Arithmetic average of the carbon dioxide emissions index and the material footprint index, both defined below. A high value implies less pressure on the planet.

Carbon dioxide emissions per capita (production): Carbon dioxide emissions produced as a consequence of human activities (use of coal, oil and gas for combustion and industrial processes, gas flaring and cement manufacture) divided by midyear population. Values are territorial emissions, meaning that emissions are attributed to the country in which they physically occur.

Carbon dioxide emissions (production) index: Carbon dioxide emissions per capita (production-based) expressed as an index using a minimum value of 0 and a maximum value of 69.85 tonnes per person. A high value implies less pressure on the planet.

Material footprint per capita: Material footprint is the attribution of global material extraction to domestic final demand of a country. The total material footprint is the sum of the material footprint for biomass, fossil fuels, metal ores and nonmetal ores. Material footprint is calculated as raw material equivalent of imports plus domestic extraction minus raw material equivalents of exports. Material footprint per capita describes the average material use for final demand.

Material footprint index: Material footprint per capita expressed as an index using a minimum value of 0 and a maximum value of 152.58. A high value implies less pressure on the planet.

Ghana's HDI for 2019 is 0.611. However, when the value is discounted for Planetary pressures, the HDI falls to 0.601, a loss of 1.6 percent and moves up 5 positions – meaning that the planetary pressures are still lower than those above Ghana. Cameroon and Kenya show losses due to planetary pressures of 0.9 percent moving 3 positions up and 1.2 percent moving 6 positions up, respectively. The average loss due to planetary pressures for medium HDI countries is 2.5 percent and for Sub-Saharan Africa it is 1.5 percent. The material foot print index for Ghana is equal to 0.977 (see Table D).

Table D: Ghana's PHDI for 2019 relative to selected countries and groups

	HDI value	Overall loss (%)	Carbon dioxide emissions per capita (production) (tonnes)	Material footprint per capita (tonnes)	Material footprint index (value)
Ghana	0.611	1.6	0.6	3.6	0.977
Cameroon	0.563	0.9	0.3	1.9	0.987
Kenya	0.601	1.2	0.4	3.0	0.980
Sub-Saharan Africa	0.547	1.5	0.8	2.8	0.982
Very High HDI	0.898	15.4	10.4	24.2	0.841
High HDI	0.753	8.6	5.1	15.2	0.900
Medium HDI	0.631	2.5	1.6	4.0	0.974
Low HDI	0.513	1.0	0.3	2.2	0.985
