RESEARCH BRIEF OF A SECOND STUDY OF

UNDERSTANDING PUBLIC PERCEPTIONS OF CLIMATE CHANGE IN CAMBODIA

KNOWLEDGE, ATTITUDES AND PRACTICES (KAP)

KAP studies are conducted to understand the knowledge, attitudes and perceptions of Cambodians about climate change, and how these are changing. Here are some of the interesting findings from the two KAP studies conducted in 2011 and 2015.

35% think the government is the most powerful institution in dealing with climate change in KAP1.

27% think the government is the most powerful institution in dealing with climate change in KAP2.

33% think their own actions

contribute to climate change in KAP1, and they include:

- Using machinery (44%)
- Cutting wood (40%)
- Burning wastes (37%)

44% think their own actions contribute to climate change in KAP2, and they include:

- Using machinery (38%)
- Cutting wood (42%)
- Burning wastes (37%)

own in KAP1. **23%** agree that THEY CAN deal with climate variability on their own in KAP2.

31% agree that THEIR **COMMUNITY CAN**

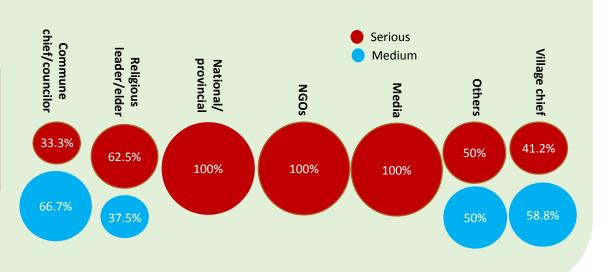

variability in KAP1. 27% agree that THEIR COMMUNITY CAN deal with climate variability in KAP2.

deal with climate

How big of a problem is Climate Change for Cambodia? People's attitudes differ...

Climate change is the problem for Cambodia since its impacts including flood, drought, and storm destroy crops and houses and these are very serious problems."

Commune chief, Ratanakiri

Do you know how people can respond to climate change?

26% in KAP1 did not know how people can respond to climate change; and among those who did not choose "don't know" option, they reported that it could be done through planting more trees, building more water control structures, asking for donations from others, and relocating to other safer places.

37% in KAP2 did not know how people can respond to climate change; and among those who did not choose "don't know" option, they reported that it could be done through planting more trees, doing nothing, diversifying crops, and getting air con/fan.

Need for targeted communication campaigns showing HOW TO RESPOND TO CLIMATE CHANGE

Practices

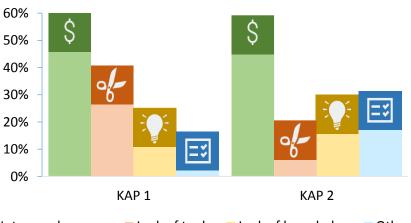

How do you respond to climate change?

21% in KAP1 and 27% in KAP2 planted more trees to cope with climate variability.
1% in KAP1 and 5% in KAP2 reduced water consumption to cope with climate variability.
4% in KAP1 and 25% in KAP2 sught advices from neighbours/friends with climate variability.
30% in KAP1 and 51% in KAP2

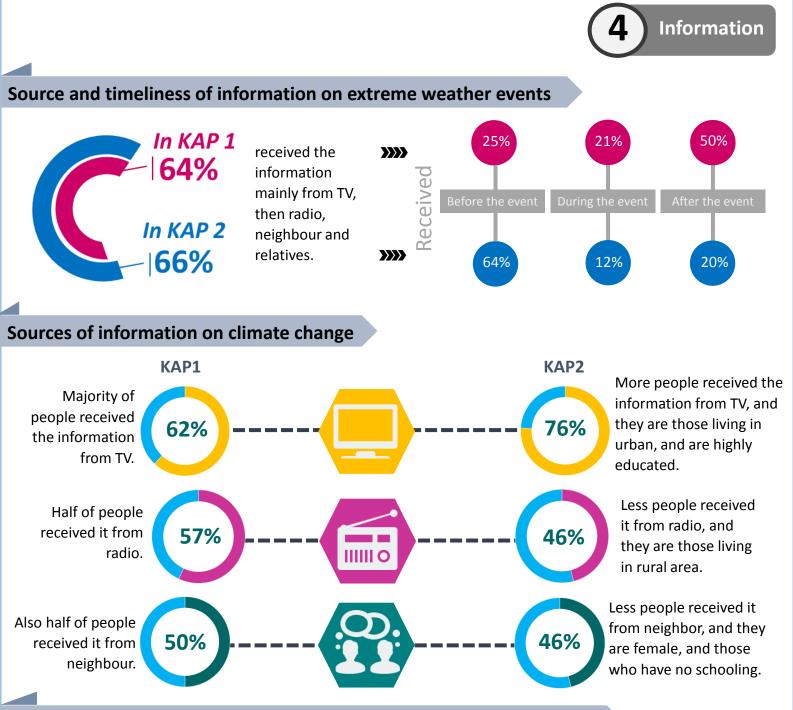

used air con./fan to cope with climate variability.

What are the barriers in responding to climate change?

In both KAP1 and KAP2, the majority of 60 respondents considered that the main barrier 50 hindering responses to climate change 40 impacts and hazards was having insufficient 30 money. The next biggest barrier was lack of 20 knowledge. Perception of the lack of tools (hardware and software) as a barrier declined by 20 percent.

Not enough money Lack of tools Lack of knowledge Others

What are the steps for follow-up knowledge, attitudes and practices?

- Promote systematic activities for raising awareness and building/instilling confidence among vulnerable groups.
- Identify the areas and population groups that need the most help in improving KAP.
- Demonstrate impacts and costs of climate change on health and livelihoods through compiling case studies.
- Disseminate and provide access to good quality information about the causes and impacts and adaptation options to help close the gap between climate adaptation plans and poverty reduction strategies.
- Empower subnational authorities and institutions to lead the development of strategic directions and guidelines for climate change adaptation and disaster risk reduction.
