# Acknowledgments

The DINA was prepared under the overall leadership of the Ministry of Planning, Investment and Economic Development in partnership with the Ministry of Humanitarian Affairs & Disaster Management of the Federal Government of Somalia (FGS), the Federal Member States (FMS) and the Benadir Regional Administration. It was undertaken with strategic support from the World Bank Group, the United Nations and the European Union, within the framework of the 2008 Joint EU-UN-WB Declaration on Post-Crisis Assessments and Recovery Planning. Financial support has been provided by the European Union under the ACP-EU Natural Disaster Risk Reduction program implemented by the WB-led Global Facility for Disaster Reduction and Recovery. Ipsos provided remote sensing and survey support, and Courage Services, Inc. provided remote sensing services.

More than 180 national and international experts from the FGS, FMS, the Benadir Regional Administration, the World Bank, the United Nations and the European Union worked intensively across 18 sector/cross-cutting teams to collect, validate and analyze data, conduct field visits to consult with sub-national authorities, international and national non-governmental organizations and civil society stakeholders, to determine recovery needs and identify interventions for medium-term recovery and long-term resilience.

# Methodology

The Somalia Drought Impact and Needs Assessment (DINA) follows the standard Post-Disaster Needs Assessment (PDNA) methodology developed by the UN System, World Bank and the European Union. This methodology incorporates a collection of analytical methods, tools and techniques developed for post-disaster assessments and recovery planning, ensuring sector-to-sector comparability and homogeneity in the definition of basic concepts of damages, losses and post-disaster recovery needs. The assessment builds on primary and secondary data related to damage and loss in the identified sectors, which are provided by FGS, FMS and development partners supporting the DINA.

**Damage and Loss Quantification:** The effects of the drought on each sector have been assessed in terms of damages and losses.

- Damage is defined as total or partial destruction of physical assets existing in the affected area. Damages occur during and immediately after the disaster and are measured in physical units (i.e., number of damaged boreholes, heads of livestock, hectares of land, etc.). Their monetary values are expressed as the replacement costs according to prices prevailing just before the event.
- Losses are defined as changes in economic flows arising from the disaster. They occur until full economic recovery and reconstruction is achieved, in some cases lasting for several years, but for the purposes of this assessment, losses have been projected up through December 2017. Typical losses include: the disruption in the production and access to goods and services, disruption in governance, and losses associated with increased or changed risk (for example, in a drought/flood cycle, the increased poverty, malnutrition, livelihoods and welfare losses and less sustainability of life cycles of the affected population).

**Classification and Quantification of Recovery Needs:** Recovery needs are the costs of recommended interventions and resources that include: the reconstruction needs estimated as the requirements for financing reconstruction, replacement or repair of the physical assets that were damaged or destroyed by the disaster; and recovery needs estimated on the basis of the financial resources required for the rehabilitation of basic services, reactivation of productive activities, or immediate reactivation of personal or household income. Recovery needs also include capacity building and operational costs for service delivery that are necessary for the implementation of interventions. Costing for recovery needs include differentials for building back better to consider quality improvements and DRR measures to be implemented to increase resilience against future disasters. For the purpose of this assessment, recovery needs are classified as short-term (Year 1); medium-term (Years 2-3); and long-term (Years 4+). Short-term recovery needs are distinct from emergency humanitarian needs. Rather than representing emergency lifesaving interventions, short-term recovery needs represent interventions of a developmental nature that need to be implemented in the short-term to have quicker results and impact on the overall recovery program. An example would be the immediate injection of capacity within the Government to lead and coordinate the recovery efforts.

Recovery needs, especially in the case of a slow-onset disaster, are typically and logically valued less than damages and losses, as the largest needs are represented in the humanitarian phase that can continue for an extended period of time. In addition, the cost of inputs required for recovery (such as livestock treatment or seeds) are typically less than the value of outputs lost due to drought (such as cattle mortality decreasing income from export, or crop failure decreasing the volume available for sale).

**Data Collection and Validation:** When compiling the preliminary findings for the Federal Member States (FMS) and the Benadir Regional Administration (BRA), the DINA team utilized secondary data from various sources and international partners such as UNOCHA, UNDP, FAO and the World Bank, as well as primary data from remote sensing analytics and household surveys. Data was analyzed by sector specialists to determine each sector's damages, losses, and needs estimates. The data was then disaggregated by pre-war region and aggregated by FMS and BRA.

The Ministry of Planning, Investment and Economic Development (MoPIED) and UN colleagues coordinated field visits to five Federal Member States: Galmudug, Hirshabelle, Jubaland, Puntland and South West, and consultations with Benadir Regional Administration authorities. The visits comprised consultations with state-level line ministries, UN agencies operational in the states, and representatives of civil society regarding data collection, needs assessment and recovery strategies.

# Introduction

The latest in a cycle of devastating protracted dry spells over the last 25 years, the current drought and the resulting humanitarian emergency have worsened existing humanitarian and development challenges in Somalia. Decades of insecurity, political instability, drought and food insecurity have disrupted desperately needed services, devastated human capital and physical infrastructure, and contributed to systematic impoverishment and displacement of the population.

The ongoing 2016-17 drought has plunged the majority of the population into food insecurity. At the peak of the drought, an estimated 6.7 million people – more than half of the population – were acutely food insecure and in need of humanitarian assistance.<sup>1</sup> The below average rainfall has resulted in a significant depletion of water resources for agricultural consumption, and livestock body conditions have deteriorated substantially. Food insecurity and scarcity of drinking water, coupled with displacement, has contributed to a stark rise in malnutrition and water-borne disease.

The impact of drought on the Somali people is informed by an interrelated set of factors that include the environment, governance, conflict, displacement and poverty. This confluence of factors has created an exceedingly complex crisis in the Horn of Africa, and it demands an equally complex analysis of the underlying drivers of drought, their impact on the Somali people and the strategies that can pave the way toward recovery and resilience.

The Somalia Drought Impact and Needs Assessment (DINA), a process led by the Federal Government of Somalia (FGS) and Federal Member States (FMS), with technical and financial support by the World Bank (WB), United Nations (UN) and European Union (EU), aims to reduce the country's vulnerability to climate shocks, strengthen resilience and significantly reduce the future risk of famine in Somalia.

Volume III of the DINA presents a breakdown of overall damages, losses and recovery needs by FMS and BRA, as well as sector-specific disaggregation of data. The FMS-level annexes serve an important purpose in capturing state-level needs, which will in turn inform the development of the Recovery and Resilience Framework (RRF) to operationalize the findings of the DINA. The state-level findings have been validated by the FMS/BRA through a process of engagement and consensus-building. Each report presents:

- An overview of pre-drought conditions
- The drought impact
- Key findings from field visits and consultations
- The drought recovery needs

---

<sup>1</sup> UNOCHA. 2017. Somali: Humanitarian Dashboard – July 2017.

# Benadir

## Overview and Pre-Drought Conditions

The Benadir Regional Administration (BRA) contains Somalia’s capital city of Mogadishu. Benadir is centrally located and served by the largest port and airport in the Somali peninsula. Benadir has the potential to be a logistical hub for the entire Horn of Africa as it is home to a number of financial institutions and is the first port of call for international shipping. Benadir has the potential to establish strong trading bodies for the import and export of goods, as well as continued refurbishment and expansion of logistical networks to develop the region’s potential as a trade and services center, increasing the share of these services as part of the region’s economic activity.<sup>2</sup> Benadir is the main financial resource for the Federal Government of Somalia through tax collection from the port and the airport, as well as levies collected from homeowners and businesses.

## DINA Findings: Drought Impact<sup>3</sup>

With damages amounting to USD 3.4 million and losses estimated at USD 6.3 million, the total effects of the drought on Benadir are expected to exceed USD 9.8 million. There are no damages or losses reported in the productive sector (Irrigated & Rain-fed Crops, Livestock and Fisheries), while the physical (Water & Sanitation, Environment and Transport), social (Health, Nutrition and Education), and cross-cutting themes make up 53.2 percent, 20.2 percent, and 26.6 percent of the total effects, respectively. The three most affected sectors are Environment & Natural Resource Management, Livelihoods & Employment, and Water Supply & Sanitation, comprising 33.1 percent, 26.6 percent, and 20.1 percent of the total effects, respectively. A breakdown of damages and losses<sup>4</sup> for Benadir can be found below:

Figure 1: Distribution of Benadir Damages

<sup>2</sup> Federal Government of Somalia. 2016. National Development Plan (2017-2019).  
<sup>3</sup> Unlike assessments following rapid onset disasters, drought assessments typically show larger economic losses than physical damages since the drought impact is predominantly felt in economic terms rather than physical impact. The combined damages and losses in turn are typically greater than the recovery needs, particularly in the case of Somalia where many of the biggest immediate needs in food security, nutrition and social protection are covered by the HRP and not the DINA. In addition, the cost of inputs required for recovery is typically less than the value of outputs lost due to drought.  
<sup>4</sup> Damages are defined as total or partial destruction of physical assets existing in the affected area. Damages occur during and immediately after the disaster. Their monetary values are expressed as the replacement costs according to prices prevailing just before the event. Losses are defined as changes in economic flows arising from the disaster. They occur until full economic recovery and reconstruction is achieved, in some cases lasting for several years, but for the purposes of this assessment, losses have been projected up to January 2018. Typical losses include the decline in output in productive sectors (agriculture, livestock, and fisheries).

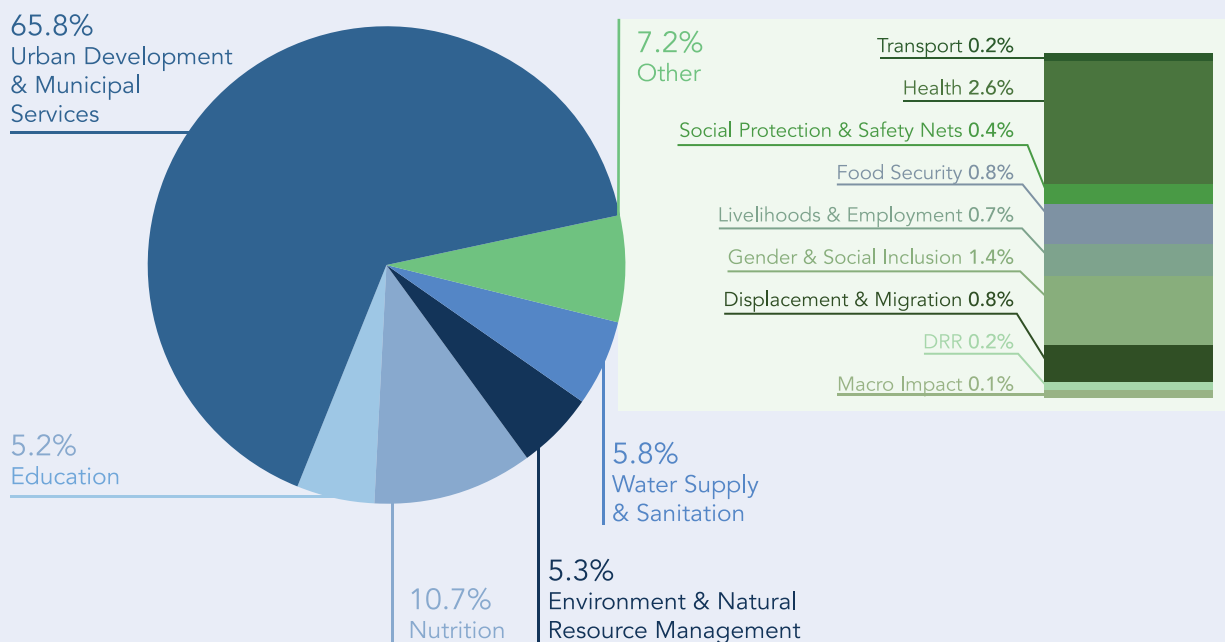

Figure 2: Distribution of Benadir Losses

### DINA Findings: Recovery Needs

Total recovery needs are estimated at USD 174.4 million. Of the sectors, Urban Development and Municipal Services makes up a majority (65.8 percent) of the total needs. Some of the other sectors, ranked in terms of needs, are Nutrition (10.7 percent), Water Supply and Sanitation (5.8 percent), Education (5.2 percent), and Environment and Natural Resource Management (5.3 percent).

Figure 3: Distribution of Benadir Needs

## DINA Field Visits and Consultations: Key Findings

The Benadir Regional Administration comprises the capital of Somalia, Mogadishu, and is the second fastest growing city in the world, creating unique needs for the region. The following sectors have been prioritized in terms of needs in the Benadir region:

**Agriculture – Fisheries:** Provision of fishing kits and the development of fish landing sites are a pressing need. The development of the dried fish industry as well as cold storage facilities are required.

**Water Supply and Sanitation:** Sustained, accessible and affordable, clean potable water is needed for all households and IDP camps/shelters. Water testing kits are required for water quality testing, for both drinking water and fishing.

**Transport:** Most roads in the area have been damaged due to conflict and lack of maintenance. Flooding and water-borne diseases are rampant due to insufficient drainage. Therefore, roads and drainage systems need rehabilitation. Provision of vehicles for public and emergency transport services also needs to be considered.

**Environment, Clean Energy and Natural Resource Management:** Pollution is an issue due to the use of charcoal for cooking, and the widespread burning of garbage. More solar and wind turbines are required to provide renewable energy. A more sustainable garbage disposal system also needs to be established.

**Health:** At least two new hospitals are required to serve Mogadishu's growing population. Mobile clinics are also needed.

**Education:** The rehabilitation and reconstruction of schools are required, along with textbooks and school nutritional programs. Mobile schooling is a need for IDP settlements and for areas that do not have functional schools.

The following cross-cutting issues also need to be considered: very high rates of youth unemployment require more job creation in terms of promoting small industries and micro-finance programs. Furthermore, the large numbers of IDPs are straining already scarce government services and resources and, therefore, require livelihood, education, employment and health assistance. Drought-mitigating factors need to be considered, especially in the areas of food security and self-reliance for the region. In terms of governance, reconciliation structures and processes need to be promoted. Consultative processes are required to explore the status of Benadir and nature of representation in the system of government moving forward.

## Annex 2: Detailed Sector Damages, Losses and Needs Tables for Benadir

<b>Table 2: Detailed Sector Damages, Losses and Needs Tables for Benadir</b>	
<b>DAMAGES</b>	<b>COST (USD)</b>
<b>Water Supply &amp; Sanitation</b>	
Boreholes	760,000
Shallow Wells	63,000
<b>Total</b>	<b>823,000</b>
<b>Environment &amp; Natural Resource Management</b>	
Xeric shrublands and grasslands desiccated	208,782
Tree cover loss in montane xeric woodlands	2,301,000
Soils eroded (wind erosion, tons)	3,728
Loss of soil fertility and associated functions	31,317
Reduction in yields of cereals and legumes	3,107
Trees lost as a result of increased charcoal production	69,813
<b>Total</b>	<b>2,617,747</b>
<b>LOSSES</b>	<b>COST (USD)</b>
<b>Water Supply &amp; Sanitation</b>	
Additional cost of water sold from Boreholes	1,035,920
Supplementation cost of water from dried, free sources	101,892
<b>Total</b>	<b>1,137,812</b>
<b>Environment &amp; Natural Resource Management</b>	
Xeric shrublands and grasslands desiccated	289,975
Tree cover loss in montane xeric woodlands	255,667
Soils eroded (wind erosion, tons)	7,457
Trees lost as a result of increased charcoal production	58,177
<b>Total</b>	<b>611,275</b>
<b>Health</b>	
Increased Incidence of Cholera	159,785
Increased Primary-basic Healthcare costs	1,158,434
Increased Incidence of Measles	98,776
<b>Total</b>	<b>1,416,994</b>
<b>Nutrition</b>	
Increased Cost of treating General Acute Malnutrition	397,853
Increased Cost of treating Severe Acute Malnutrition	159,260
<b>Total</b>	<b>557,113</b>
<b>Livelihoods &amp; Employment</b>	
Transporters	1,163,160
Petty Traders	363,280

Milk Traders	1,057,532
Skins and Hides	6,148
<b>Total</b>	<b>2,590,120</b>
<b>NEEDS</b>	<b>COST (USD)</b>
<b>Water Supply &amp; Sanitation</b>	
Construction of new Boreholes	4,277,778
Rehabilitation of Boreholes	844,444
Construction of new Shallow wells	107,500
Rehabilitation of Shallow wells	121,333
Construction of new Berkads	11,278
Rehabilitation of Berkads	12,000
Urban/Rural sanitation (drainage, sewage, and solid waste management)	2,777,778
Institutional strengthening and Capacity building	1,888,889
<b>Total</b>	<b>10,041,000</b>
<b>Transport</b>	
Construction and Rehabilitation of Roads	266,667
<b>Total</b>	<b>266,667</b>
<b>Environment &amp; Natural Resource Management</b>	
Immediate capacity building of government forest rangers	111,111
Immediate re-seeding of selected rangelands with fast-growing grass species	277,778
Setting up germplasm mother blocks (seed production zones for indigenous fruit tree species)	277,778
Improvement of energy efficiency of existing charcoal carbonization and kilning systems	444,444
Scaling up evergreen agriculture by integrating with trees-on-farm agroforestry systems and ISFM	666,667
Development of legislation to support zoning of wildlife parks, migratory corridors	55,556
Training forest end users on sustainable extractive techniques for NWFPs	277,778
Technical capacity improvement of Somali government - remote sensing, GIS, national lab	222,222
Capital expenditure costs for setting up LPG plant in Mogadishu and Bossaso	6,000,000
Rehabilitation of selected gullies and other severely degraded ecosystems	444,444
Promoting wide-scale adoption of low-cost integrated soil fertility management (ISFM) for improving soil resources	166,667
Assisting the Somali government with the development of a biomass energy policy	166,667
Develop a Power Master Plan	47,417
Cross Border Electrification and Interconnector Study	55,556
<b>Total</b>	<b>9,214,084</b>

<b>Health</b>	
Engaging the public in promotion of health, hygiene and safe drinking water, sanitation, environmental hygiene, food safety, and safe waste disposal	228,788
Promoting food-borne diseases laboratory-based surveillance by developing food safety guidelines and interventions	228,788
Introducing standardized rapid diagnostic technologies for prevalent communicable diseases	137,273
Active disease surveillance and early warning system	228,788
Prepositioning medical supplies and kits to undertake coordinated rapid response	228,788
Establishing an effective health information system that provides accurate and timely health data for evidence planning and implementation supported by monitoring and evaluation	137,273
Increasing cholera treatment centers in all regions	457,576
Promoting participation in improving public health at community level	228,788
Ensure availability of essential medicines, vaccines, and commodities	1,222,621
Establishing emergency response services	228,788
Ensuring immunization of all children and pregnant women against the major child killer diseases	457,576
Deploying more health care workers that are competent on tasks and treat patients with dignity, respect, and compassion	320,303
Supporting fixed and mobile clinics	457,576
<b>Total</b>	<b>4,562,929</b>
<b>Nutrition</b>	
Surveillance and M&E operations	1,865,620
Mobile clinic and Nutrition rehabilitation vans	3,731,239
Vitamin A Supplementation	279,843
People living with HIV and AIDS	373,124
Deworming	279,843
Capacity building	2,798,430
Procurement of material and rehabilitation	3,731,239
Health promotion and community mobilization	1,865,620
Implementation and operational support	3,731,239
<b>Total</b>	<b>18,656,197</b>
<b>Education</b>	
Learning spaces	4,030,000
Teachers	2,704,800
Learning materials/ kits	911,272
CEC structures to be supported	604,500
Data Tracking Costs	906,750
<b>Total</b>	<b>9,157,322</b>

<b>Urban Development &amp; Municipal Services</b>	
Shelter	39,775,500
Education	11,603,810
Health	730,319
Water and Sanitation	3,212,387
Jobs	57,998,520
Institutional Strengthening	1,500,000
<b>Total</b>	<b>114,820,536</b>
<b>Social Protection &amp; Safety Nets</b>	
Injection of minimum capacity in MoHADM and MoPIED	9,333
Social Protection Policy and Framework, Vulnerability Analysis, Capacity Development of Government, Communication Strategy	84,167
Database Inventory and Analysis	5,556
Design of pilot incl. registry, targeting methodology, transfer systems, monitoring systems, grievance mechanism, vetting	277,778
Pilot of system in select geographic areas (incl. urban and rural) targeting 100,000	355,556
<b>Total</b>	<b>732,389</b>
<b>Food Security</b>	
Improved food storage to reduce waste	1,111,111
Improved food security early warning systems	277,778
Support for the development of a national food security strategy	6,667
Support for the development of a national poverty reduction strategy	13,333
<b>Total</b>	<b>1,408,889</b>
<b>Livelihoods &amp; Employment</b>	
Support to Women and Youth to engage in the renewable energy sector	1,111,111
Support to Govt. Institutions to improve and/or establish Labor Market Information Services	105,556
Support To FGS and Federal State Govts to coordinate the E&L sector	11,111
<b>Total</b>	<b>1,227,778</b>
<b>Gender &amp; Social Inclusion</b>	
Implementation of sex, age disaggregated data (SADD) and gender analysis tools	238,889
Gender-responsive governance and promote women's participation and leadership	244,444
Promote gender equality in disaster risk reduction	194,444
Women sustainable economic and livelihoods development	1,583,333
Gender based Violence (GBV) and targeted responses	194,444
<b>Total</b>	<b>2,455,556</b>
<b>Governance</b>	
<b>Total</b>	<b>TBD</b>
<b>Displacement &amp; Migration</b>	

Collection of sex and age disaggregated profile data of displaced and returning populations	111,111
Monitoring costs (social cohesion, displacement movements, etc.)	27,778
IDP personal identity documentation and civil registration	55,556
Capacity building of state and local authorities to promote recovery and resilience of IDP populations	55,556
Support Community-based participatory planning processes	111,111
Support for the participation in civic life, dispute resolution and peaceful co-existence in displacement affected areas.	55,556
Promoting land tenure security through improved policies and frameworks, including improved land use planning	27,778
Development and adoption of federal policy on internal displacement and reintegration of returnees	27,778
Assessment of conditions for safe return through area-based solutions analysis	27,778
Collect population profile data on remote/rural	55,556
Skills development and livelihoods restoration	666,667
Support for market access and strengthened value chains for partial returns (including those with family member remaining in urban areas)	55,556
Support the establishment and strengthening of local authorities	55,556
Communication and sensitization to support re/integration of IDPs and to enable participation in civic life, dispute resolution and peaceful co-existence.	55,556
Establish/strengthen transparent dispute resolution mechanism to manage land disputes	55,556
<b>Total</b>	<b>1,444,444</b>
<b>DRR</b>	
DRM Policy, Legislation and Institutional Harmonization	23,611
Capacity building of National DRM institutions	87,500
Early warning and information management system.	118,056
Drought Management system	48,611
<b>Total</b>	<b>277,778</b>
<b>Macro Impact</b>	
Mobile money for drought response	111,111
Regulatory support for the ICT Sector	22,222
Developing a National ID system	5,556
Financial Services	55,556
<b>Total</b>	<b>194,444</b>

# Galmudug

## Overview and Pre-Drought Conditions

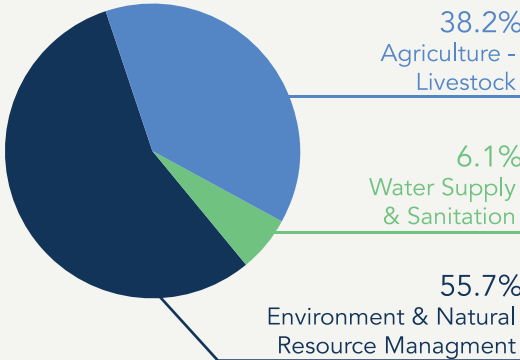

The state of Galmudug comprises the Galgaduud region and the southern portion of the Mudug region, with the regional capital located in Dhusamareb. The largest city is Galkayo, which is jointly administered by Galmudug and Puntland.

Galmudug is one of the newest formed states located in the center of Somalia and has the potential to expand and develop a strong livestock exportation industry with focus on sustainable range management, exploitation of subsurface water resources and development of standardized market facilities. Additionally, Galmudug has untapped mineral deposits, such as meerschaum, fluorspar, and uranium deposits, that are expected to be second in richness only to those found in Australia.<sup>6</sup>

## DINA Findings<sup>7</sup>: Drought Impact<sup>8</sup>

With damages amounting to USD 127 million and losses estimated at USD 269 million, the total effects of the drought in Galmudug are expected to exceed USD 395 million. The productive sector (Irrigated & Rain-fed Crops, Livestock and Fisheries) accounts for 60.1 percent of all the effects, while the physical (Water & Sanitation, Environment and Transport), social (Health, Nutrition and Education), and cross-cutting themes make up 37.8 percent, 1.1 percent, and 1 percent, respectively. The two most affected sectors are Livestock, and Environment & Natural Resource Management, comprising 58.3 percent and 35.4 percent of the total effects, respectively. A breakdown of damages and losses<sup>9</sup> for Galmudug can be found below:

Figure 4: Distribution of Galmudug Damages

<sup>6</sup> Federal Government of Somalia. 2016. National Development Plan (2017-2019).  
<sup>7</sup> This report is based on regionally disaggregated data for Galgaduud region and the southern half of Mudug region. The inclusion or exclusion of regions in a given FMS does not imply any judgment on the part of the authors of this report on the legal status of any territory or the endorsement or acceptance of such boundaries.  
<sup>8</sup> Unlike assessments following rapid onset disasters, drought assessments typically show larger economic losses than physical damages since the drought impact is predominantly felt in economic terms rather than physical impact. The combined damages and losses in turn are typically greater than the recovery needs, particularly in the case of Somalia where many of the biggest immediate needs in food security, nutrition and social protection are covered by the HRP and not the DINA. In addition, the cost of inputs required for recovery is typically less than the value of outputs lost due to drought.  
<sup>9</sup> Damages are defined as total or partial destruction of physical assets existing in the affected area. Damages occur during and immediately after the disaster. Their monetary values are expressed as the replacement costs according to prices prevailing just before the event. Losses are defined as changes in economic flows arising from the disaster. They occur until full economic recovery and reconstruction is achieved, in some cases lasting for several years, but for the purposes of this assessment, losses have been projected up to January 2018. Typical losses include the decline in output in productive sectors (agriculture, livestock, and fisheries).

Figure 5: Distribution of Galmudug Losses

### DINA Findings: Recovery Needs

Total recovery needs are estimated at USD 78.4 million. Of the sectors, Water Supply & Sanitation have the most needs, representing 19.2 percent of total needs, followed by Nutrition (14.2 percent), Irrigated and Rain-fed Crops (12.9 percent), Livestock (12.4 percent), and Health (8.7 percent).

### DINA Field Visits and Consultations: Key Findings

The Ministry of Planning, Investment and Economic Development (MoPIED) and UN colleagues coordinated a field visit to Adado to undertake consultations with state-level line ministries, UN agencies operational in the state, and civil society representatives, regarding data collection, needs assessment and recovery strategies. Based on these consultations, the following sectors in Galmudug State were identified as having been severely affected by the drought:

**Agriculture – Livestock:** Livestock is the main source of income and food in the state. More than six out of 10 of the livestock population was lost during the drought. The absence of pasture and fodder has been identified as the main reason for damages and losses in this sector. The introduction of drought-resilient pasture has been identified as a need in the state. The establishment of sufficient water sources and water catchments is also a necessary intervention.

**Education:** 25 out of 125 education centers were closed due to the drought. The pre-drought enrollment numbers were estimated at 27,156 students, and 18 percent of this has been estimated to have dropped out due to the drought. Of this 10 percent were boys and 9 percent girls. The impact of the drought, urban migration, conflict, and the absence of school feeding programs were identified as main factors for the drop-outs.

# Hirshabelle

## Overview and Pre-Drought Conditions

Hirshabelle State is comprised of the Hiiraan and Middle Shabelle regions. The capital of the state is Jowhar.

Historically, the Hiiraan and Middle Shabelle areas served as the breadbasket for Somalia.<sup>11</sup> Hirshabelle benefits from three elements: the Shabelle River running the length of the state, geographical access to the large markets of Mogadishu and Ethiopia, and a long coastline with well-established artisanal fishing communities. Hirshabelle has the capacity for the development of large irrigated agricultural projects and the rehabilitation and re-establishment of factories such as the Jowhar sugar factory and the Balcad clothes factory that produced tertiary products from the local production of sugar and cotton.

Due to the Shabelle River, the land across Hirshabelle is typically fertile in non-drought conditions and can be used to produce a range of agricultural produce

including fruits, wheat, barley, rice, sugarcane and cotton. The livestock industry benefits from a variety of livestock as well as fodder and water.

## DINA Findings<sup>12</sup>: Drought Impact<sup>13</sup>

With damages amounting to USD 78 million and losses estimated at USD 195 million, the total effects of the drought in Hirshabelle are expected to exceed USD 273 million. The productive sector (Irrigated & Rain-fed Crops, Livestock and Fisheries) accounts for 59.1 percent of all the effects, while the physical (Water & Sanitation, Environment and Transport), social (Health, Nutrition and Education), and cross-cutting themes make up 36.9 percent, 2.1 percent, and 1.9 percent, respectively. The two most affected sectors are Livestock and Environment & Natural Resource Management, comprising 46.9 percent and 36 percent of the total effects, respectively. A breakdown of damages and losses<sup>14</sup> for Hirshabelle can be found on page 30.

<sup>11</sup> Federal Government of Somalia. 2016. National Development Plan (2017-2019).

<sup>12</sup> This report is based on regionally disaggregated data for Hiraan and Middle Shabelle regions.

<sup>13</sup> Unlike assessments following rapid onset disasters, drought assessments typically show larger economic losses than physical damages since the drought impact is predominantly felt in economic terms rather than physical impact. The combined damages and losses in turn are typically greater than the recovery needs, particularly in the case of Somalia where many of the biggest immediate needs in food security, nutrition and social protection are covered by the HRP and not the DINA. In addition, the cost of inputs required for recovery is typically less than the value of outputs lost due to drought.

<sup>14</sup> Damages are defined as total or partial destruction of physical assets existing in the affected area. Damages occur during and immediately after the disaster. Their monetary values are expressed as the replacement costs according to prices prevailing just before the event. Losses are defined as changes in economic flows arising from the disaster. They occur until full economic recovery and reconstruction is achieved, in some cases lasting for several years, but for the purposes of this assessment, losses have been projected up to January 2018. Typical losses include the decline in output in productive sectors (agriculture, livestock, and fisheries).

Figure 7: Distribution of Hirshabelle Damages

Figure 8: Distribution of Hirshabelle Losses

### DINA Findings: Recovery Needs

Total recovery needs are estimated at USD 141.6 million. Sectors showing the greatest needs include Irrigated and Rain-fed Crops (45.3 percent of total needs), Water Supply and Sanitation (14.2 percent), Livestock (9.2 percent), Health (6.4 percent), and Nutrition (6.1 percent).

Figure 9: Distribution of Hirshabelle Needs

### DINA Field Visits and Consultations: Key Findings

The Ministry of Planning, Investment and Economic Development (MoPIED) and UN colleagues coordinated a field visit to Jowhar to undertake consultations with state-level line ministries, UN agencies operational in the state, and civil society representatives regarding data collection, needs assessment and recovery strategies. Based on these consultations, the following sectors were identified as key priorities for recovery and resilience in Hirshabelle State:

**Agriculture – Crops:** Farmers in the region do not have sufficient understanding of moderate farming and market requirement standards. Considering this, comprehensive capacity development programs are needed on moderate farming techniques and markets.

**Agriculture - Livestock:** An animal feeding “grass farming” project is recommended for livestock feeding. Re-stocking and donation of animals to vulnerable communities is also recommended.

**Transport:** Inadequate road infrastructure needs to be addressed through road construction and rehabilitation.

**Health:** There are inadequate health facilities, especially in Jowhar, and the establishment of hospitals is therefore required.

In terms of cross-cutting areas, food security was identified as an issue, with severely reduced food production and demand exceeding supply, causing price hikes in food beyond the means of farmers and pastoralists. Scaling up of long-term food security assistance programs was therefore considered a pressing need. In terms of livelihoods, the construction of a new marketplace in Jowhar and the renovation of existing ones was considered necessary, including the construction of new butcher markets. Overall drought-related data collection needs to be increased to better anticipate needs and inform necessary responses to drought.

# Jubaland

## Overview and Pre-Drought Conditions

Jubaland State is comprised of the regions of Gedo, Middle Juba and Lower Juba. Its largest city is Kismayo, situated on the coast near the mouth of the Juba River. The Kismayo port provides the state with the opportunity to be a logistics gateway for East Africa.

Like most parts of Somalia, recurring severe drought has been the main natural hazard in recent decades, significantly affecting agropastoral livelihoods. Jubaland has also been affected by other climatic events such as the flooding of the Juba River, which often affects the surrounding communities, leading to displacement of large populations.

The Juba River provides Jubaland with the potential for irrigated agriculture ranging from crops such as bananas, sugar cane, simsim seeds and cotton to staple foods such as rice, sorghum and millet.

## DINA Findings<sup>16</sup>: Drought Impact<sup>17</sup>

With damages amounting to USD 171 million and losses estimated at USD 337 million, the total effects of the drought in Jubaland are expected to exceed USD 508 million. The productive sector (Irrigated & Rain-fed Crops, Livestock and Fisheries) accounts for 43.1 percent of all the effects, while the physical (Water & Sanitation, Environment and Transport), social (Health, Nutrition and Education), and cross-cutting themes make up 54.2 percent, 1.1 percent, and 1.5 percent, respectively. The two most affected sectors are Environment & Natural Resource Management and Livestock, comprising 53.3 percent and 37.4 percent of the total effects, respectively. A breakdown of damages and losses<sup>18</sup> for Jubaland can be found below:

Figure 10: Distribution of Jubaland Damages

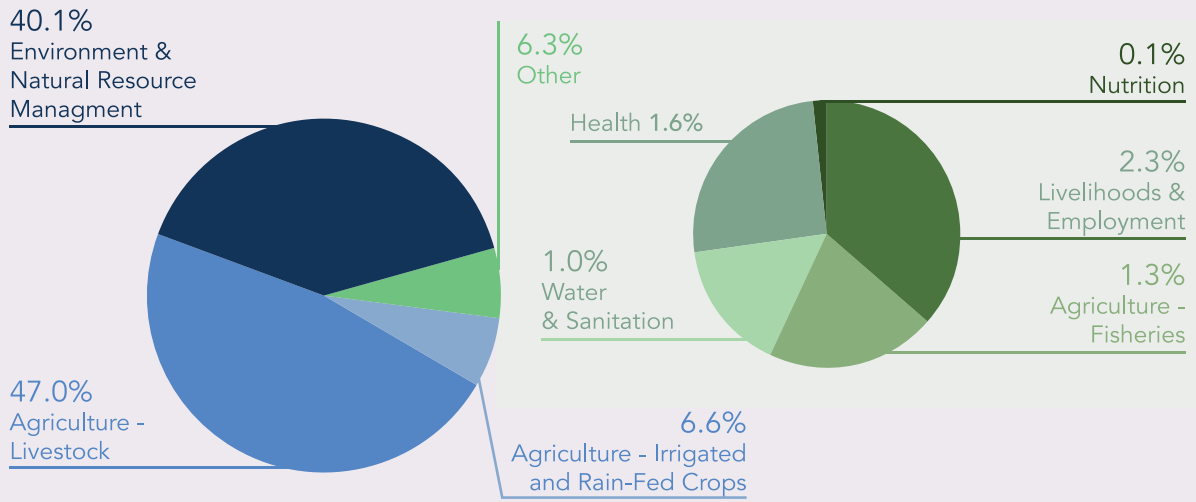

<sup>16</sup> This report is based on regionally disaggregated data for Gedo, Middle Juba and Lower Juba regions.

<sup>17</sup> Unlike assessments following rapid onset disasters, drought assessments typically show larger economic losses than physical damages since the drought impact is predominantly felt in economic terms rather than physical impact. The combined damages and losses in turn are typically greater than the recovery needs, particularly in the case of Somalia where many of the biggest immediate needs in food security, nutrition and social protection are covered by the HRP and not the DINA. In addition, the cost of inputs required for recovery is typically less than the value of outputs lost due to drought.

<sup>18</sup> Damages are defined as total or partial destruction of physical assets existing in the affected area. Damages occur during and immediately after the disaster. Their monetary values are expressed as the replacement costs according to prices prevailing just before the event. Losses are defined as changes in economic flows arising from the disaster. They occur until full economic recovery and reconstruction is achieved, in some cases lasting for several years, but for the purposes of this assessment, losses have been projected up to January 2018. Typical losses include the decline in output in productive sectors (agriculture, livestock, and fisheries).

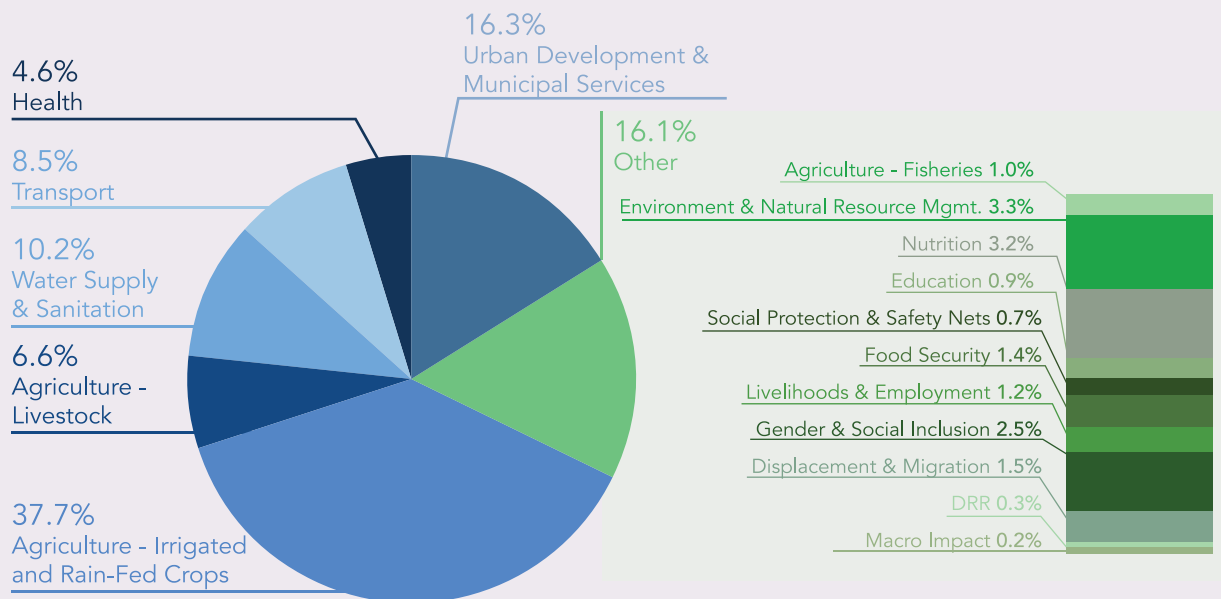

Figure 11: Distribution of Jubaland Losses

### DINA Findings: Recovery Needs

Total recovery needs are estimated at USD 296.4 million. Of the sectors, Irrigated and Rain-fed Crops has the most needs (37.7 percent of total needs), followed by Urban Development and Municipal Services (16.3 percent), Water Supply and Sanitation (10.2 percent), Transport (8.5 percent), Livestock (6.6 percent) and Health (4.6 percent).

Figure 12: Distribution of Jubaland Needs

## DINA Field Visits and Consultations: Key Findings

The Ministry of Planning, Investment and Economic Development (MoPIED) and UN colleagues coordinated a field visit to Kismaayo to undertake consultations with state-level line ministries, UN agencies operational in the state, and civil society representatives, regarding data collection, needs assessment and recovery strategies. Based on these consultations, the following sectors were identified as key priorities for recovery and resilience in Jubaland State:

**Agriculture – Livestock:** Key priorities in this sector are to promote the delivery of quality veterinary and TVET education and enhance organizational and institutional capacity in connection with both the physical (infrastructure) and the technical capacity of the Ministry of Livestock.

**Health and Nutrition:** Rehabilitation of health facilities in areas recovered from non-state actors, pre-positioning medical supplies and medicine for the treatment of emergency cases, and expanding the immunization program in the state were identified as needs in this sector.

**Education:** Construction of new schools to address the needs of IDPs in host communities is an important need.

Gender, as a cross-cutting area, was also identified as a key priority, with focus required on formulating a gender policy for the state, and interventions for the economic empowerment of women and the prevention of gender-based violence.

## Annex 7: Total Damages, Losses and Needs for Jubaland<sup>19</sup>

# Puntland

## Overview and Pre-Drought Conditions

Puntland, situated in the northeast of Somalia with its capital at Garowe, is considered one of the more stable states in Somalia in terms of socio-economic conditions and poverty reduction.<sup>20</sup> A major seaport in its largest city, Bosaso, is situated in the Gulf of Aden next to one of the world’s largest trade routes. This, along with its potential to serve the greater Horn of Africa region with a customer base of more than 100 million people, points to the potential for the development of Puntland as a trade and logistics hub.<sup>21</sup>

Puntland has a large livestock sector with the capacity to increase the quantity and quality of its livestock exports, as well as to develop a value addition industry such as leather tanning and the design and production of leather products.

## DINA Findings<sup>22</sup>: Drought Impact<sup>23</sup>

With damages amounting to USD 310 million and losses estimated at USD 624 million, the total effects of the drought in Puntland are expected to exceed USD 934 million. The productive sector (Irrigated & Rain-fed Crops, Livestock and Fisheries) accounts for 62.7 percent of all the effects, while the physical (Water & Sanitation, Environment and Transport), social (Health, Nutrition and Education), and cross-cutting themes make up 31.1 percent, 0.8 percent, and 1.2 percent, respectively. The two most affected sectors are Livestock, and Environment & Natural Resource Management, comprising 62.7 percent and 29 percent of the total effects, respectively. A breakdown of damages and losses<sup>24</sup> for Puntland can be found below:

Figure 13: Distribution of Puntland Damages

<sup>20</sup> Federal Government of Somalia. 2016. National Development Plan (2017-2019).

<sup>21</sup> Ibid.

<sup>22</sup> This report is based on regionally disaggregated data for Bari, Nugaal, Sool, Sanaag and the northern half of Muduug. The inclusion or exclusion of regions in a given FMS does not imply any judgment on the part of the authors of this report on the legal status of any territory or the endorsement or acceptance of such boundaries.

<sup>23</sup> Unlike assessments following rapid onset disasters, drought assessments typically show larger economic losses than physical damages since the drought impact is predominantly felt in economic terms rather than physical impact. The combined damages and losses in turn are typically greater than the recovery needs, particularly in the case of Somalia where many of the biggest immediate needs in food security, nutrition and social protection are covered by the HRP and not the DINA. In addition, the cost of inputs required for recovery is typically less than the value of outputs lost due to drought.

<sup>24</sup> Damages are defined as total or partial destruction of physical assets existing in the affected area. Damages occur during and immediately after the disaster. Their monetary values are expressed as the replacement costs according to prices prevailing just before the event. Losses are defined as changes in economic flows arising from the disaster. They occur until full economic recovery and reconstruction is achieved, in some cases lasting for several years, but for the purposes of this assessment, losses have been projected up to January 2018. Typical losses include the decline in output in productive sectors (agriculture, livestock, and fisheries).

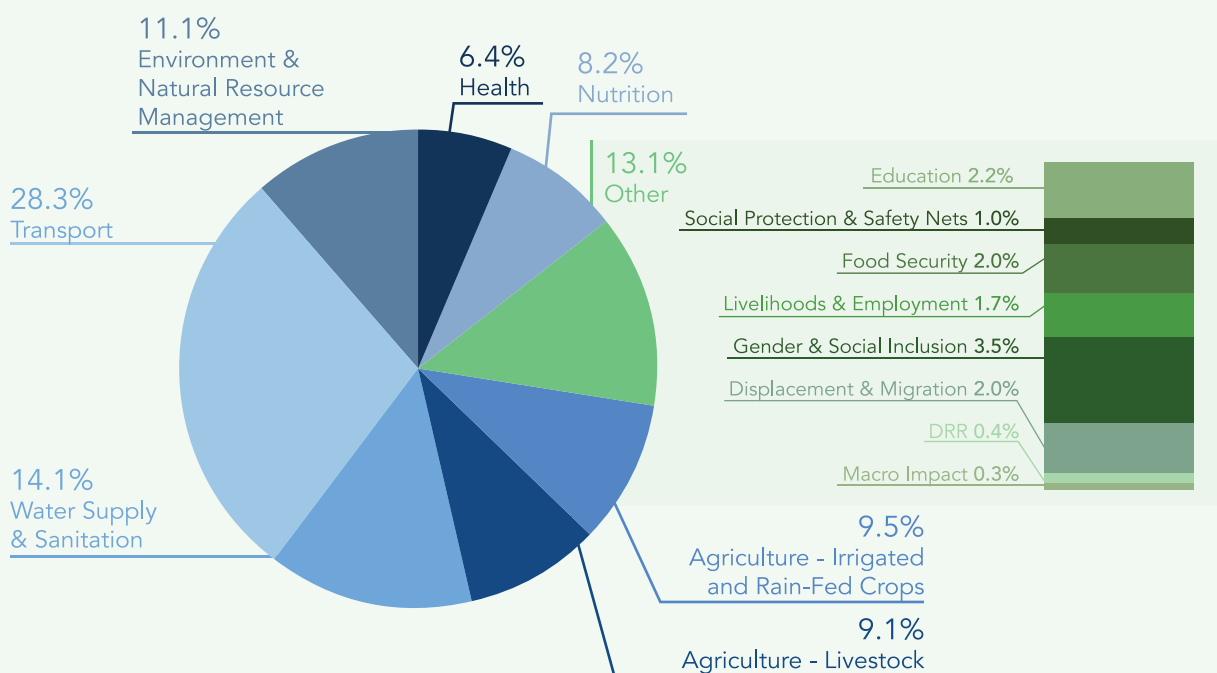

Figure 14: Distribution of Puntland Losses

### DINA Findings: Recovery Needs

Total recovery needs are estimated at USD 319.7 million. Transport, and Water & Sanitation have the largest needs, representing 28.3 percent and 14.1 percent of total needs, followed by Environment, Clean Energy and Natural Resource Management (11.1 percent), Irrigated and Rain-fed Crops (9.5 percent), Livestock (9.1 percent), Nutrition (8.2 percent) and Health (6.4 percent).

Figure 15: Distribution of Puntland Needs

### DINA Field Visits and Consultations: Key Findings

The Ministry of Planning, Investment and Economic Development (MoPIED) and UN colleagues coordinated a field visit to Garowe, in collaboration with the Puntland Ministry of Planning and International Cooperation, with line ministries, UN agencies operational in the state, and civil society representatives, regarding data collection, needs assessment and recovery strategies. Based on these consultations, the following sectors were identified as key priorities for recovery and resilience in Puntland State:

**Agriculture – Crops, Livestock and Fisheries:** The majority of pastoralists have lost their livestock due to the lack of grazing land and water, leading to a reluctance to rear livestock. Therefore, a restocking process will need to be undertaken, as well as the promotion of other industries such as growing Moxor (frankincense) and fisheries. More losses in crops are also expected.

**Water Supply and Sanitation:** A number of boreholes have been damaged due to the extreme usage and limited spare parts as a result of the drought, resulting in water shortages in many rural areas.

**Transport:** Many of the roads have been damaged due to the lack of maintenance. Some of these roads are situated in towns, while others connect towns and districts.

**Health and Education:** A number of existing facilities need to be repaired and reconstructed, while new facilities need to be constructed in drought-affected districts as well as towns hosting larger numbers of IDPs, such as Galkayo.

With regard to cross-cutting areas, gender and employment creation were identified as important focus areas in terms of promoting small industries and macro-finance programs.

# Somaliland

## Overview and Pre-Drought Conditions

Somaliland was formed in 1991 in the wake of the collapse of the central government of Somalia. Its capital is Hargeisa, and other major population centers include the port town of Berbera and the livestock center of Burao. While still a characteristically pastoral society, Somaliland has experienced an accelerated process of urbanization with the percentage of the population living in cities now exceeding 50 percent.<sup>26</sup> Nomadic communities constitute 34 percent of the total population.

The region depends on livestock for up to 60 percent of its revenue base and 28 percent of its GDP. Around half of the population is classified as agropastoralists who either engage in crop production and/or livestock rearing. Before the ban by Saudi Arabia on livestock imports from Somalia was instituted in December 2016, Somaliland exported on average 3 million livestock to Gulf Arab markets. Crop agriculture is primarily subsistence in nature, and the principle crops are

sorghum and maize. Horticultural crops grown for the local market include tomatoes, lettuce, onions, peppers, cabbages, oranges, lemons, and papaya.

## DINA Findings<sup>27</sup>: Drought Impact<sup>28</sup>

With damages amounting to USD 257 million and losses estimated at USD 617 million, the total effects of the drought in Somaliland are expected to exceed USD 874 million. The productive sector (Irrigated & Rain-fed Crops, Livestock and Fisheries) accounts for 65 percent of all the effects, while the physical (Water & Sanitation, Environment and Transport), social (Health, Nutrition and Education), and cross-cutting themes make up 32.7 percent, 0.9 percent, and 1.5 percent, respectively. The two most affected sectors are Livestock and Environment & Natural Resource Management, comprising 63.6 percent and 30.1 percent of the total effects, respectively. A breakdown of damages and losses<sup>29</sup> for Somaliland can be found on page 66.

<sup>26</sup> Somaliland NDP II: 2017-2022, pg. 25 - [http://slministryofplanning.org/images/front-page/Somaliland\\_NDP\\_II\\_Final.pdf](http://slministryofplanning.org/images/front-page/Somaliland_NDP_II_Final.pdf).

<sup>27</sup> This report is based on regionally disaggregated data for Awdal, Togdheer, Woqooyi Galbeed, Sool and Sanaag regions. The inclusion or exclusion of regions in a given FMS does not imply any judgment on the part of the authors of this report on the legal status of any territory or the endorsement or acceptance of such boundaries.

<sup>28</sup> Unlike assessments following rapid onset disasters, drought assessments typically show larger economic losses than physical damages since the drought impact is predominantly felt in economic terms rather than physical impact. The combined damages and losses in turn are typically greater than the recovery needs, particularly in the case of Somalia where many of the biggest immediate needs in food security, nutrition and social protection are covered by the HRP and not the DINA. In addition, the cost of inputs required for recovery is typically less than the value of outputs lost due to drought.

<sup>29</sup> Damages are defined as total or partial destruction of physical assets existing in the affected area. Damages occur during and immediately after the disaster. Their monetary values are expressed as the replacement costs according to prices prevailing just before the event. Losses are defined as changes in economic flows arising from the disaster. They occur until full economic recovery and reconstruction is achieved, in some cases lasting for several years, but for the purposes of this assessment, losses have been projected up to January 2018. Typical losses include the decline in output in productive sectors (agriculture, livestock, and fisheries).

Figure 16: Distribution of Somaliland Damages

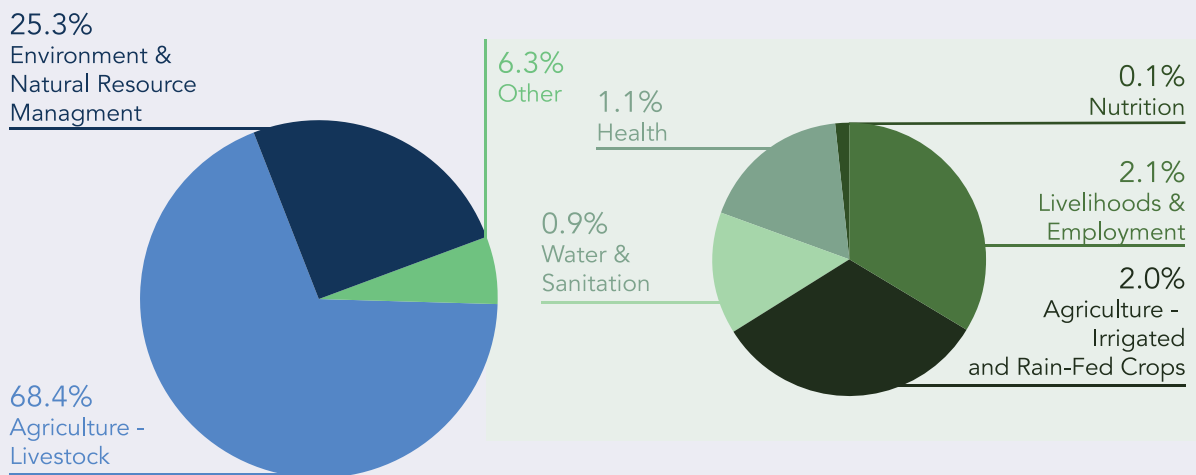

Figure 17: Distribution of Somaliland Losses

### DINA Findings: Recovery Needs

Total recovery needs are estimated at USD 314.4 million. Of the sectors, Irrigated and Rain-fed Crops have the most needs, representing 25.5 percent of total needs, followed by Water Supply and Sanitation (16 percent), Livestock (10.3 percent), Environment, Clean Energy and Natural Resource Management (9.9 percent), Transport (9.5 percent) and Nutrition (6.8 percent).

# South West State

## Overview and Pre-Drought Conditions

South West state is comprised of the Bay, Bakool, and Lower Shabelle regions.<sup>31</sup> The official capital is the coastal city of Berawe in Lower Shabelle. However, Baidoa in the Bay region is now the provisional capital, with the state government based here due to security concerns.

South West state of Somalia is potentially an agriculturally rich area with both the Juba and Shebelle Rivers providing a strong point for the development and expansion of irrigated and rain-fed agriculture. The Juba and Shebelle Rivers are prime locations for the development of dual-use dams dedicated to the production of electricity and irrigation programs for sustained year-round crop production. Fisheries are also a major economic driver due the presence of the nation's largest artisanal fishing communities, based in Lower Shebelle. Additionally, previous mineral prospects and surveys indicate that South West state has large, untapped deposits of iron and uranium.

## DINA Findings<sup>32</sup>: Drought Impact<sup>33</sup>

With damages amounting to USD 202 million and losses estimated at USD 425 million, the total effects of the drought in South West State are expected to exceed USD 628 million. The productive sector (Irrigated & Rain-fed Crops, Livestock and Fisheries) accounts for 62.8 percent

of all the effects, while the physical (Water & Sanitation, Environment and Transport), social (Health, Nutrition and Education), and cross-cutting themes make up 34.9 percent, 1.1 percent, and 1.2 percent, respectively. The three most affected sectors are Environment & Natural Resource Management, Irrigated and Rain-fed Crops, and Livestock, comprising 33.4 percent, 32.8 percent, and 29.5 percent of the total effects, respectively.

In addition, South West State has been affected by the movement of displaced persons during this drought period. In Baidoa alone, as of 31st August 2017, 234,105 new IDPs had arrived since November 2016, surpassing the host community population in the city. This continues to exert pressure on service delivery and infrastructure in urban and peri-urban areas.<sup>34</sup>

Suggested recovery needs over the next five years are highlighted below; however, a more detailed list of recovery interventions can be found in the *Drought Intervention and Recovery Plan, October 2017 to March 2019* of the South West State of Somalia. This describes needs by sector and by district, as well as proposing a governance and monitoring structure for interventions over 18 months.

A breakdown of damages and losses<sup>35</sup> for South West State can be found on page 78.

<sup>31</sup> Federal Government of Somalia. 2016. National Development Plan (2017-2019).

<sup>32</sup> This report is based on regionally disaggregated data for Bay, Bakool and Lower Shabelle regions.

<sup>33</sup> Unlike assessments following rapid onset disasters, drought assessments typically show larger economic losses than physical damages since the drought impact is predominantly felt in economic terms rather than physical impact. The combined damages and losses in turn are typically greater than the recovery needs, particularly in the case of Somalia where many of the biggest immediate needs in food security, nutrition and social protection are covered by the HRP and not the DINA. In addition, the cost of inputs required for recovery is typically less than the value of outputs lost due to drought.

<sup>34</sup> Drought Intervention and Recovery Plan, Oct 2017 to March 2019.

<sup>35</sup> Damages are defined as total or partial destruction of physical assets existing in the affected area. Damages occur during and immediately after the disaster. Their monetary values are expressed as the replacement costs according to prices prevailing just before the event. Losses are defined as changes in economic flows arising from the disaster. They occur until full economic recovery and reconstruction is achieved, in some cases lasting for several years, but for the purposes of this assessment, losses have been projected up to January 2018. Typical losses include the decline in output in productive sectors (agriculture, livestock, and fisheries).

Health information poster with illustrations of people and text in a local language.

Figure 19: Distribution of South West State Damages

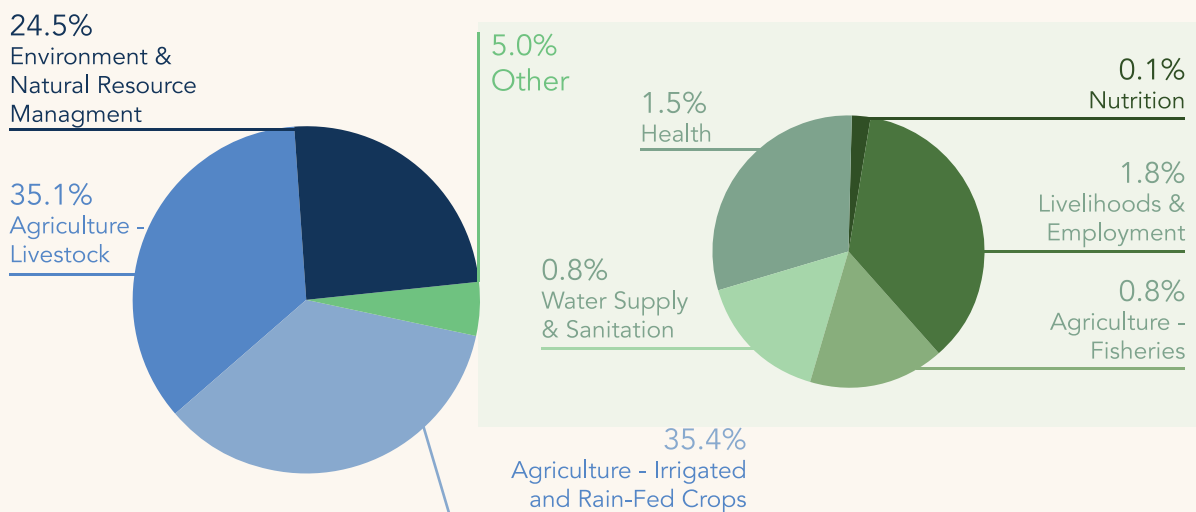

Figure 20: Distribution of South West State Losses

### DINA Findings: Recovery Needs

Total recovery needs are estimated at USD 502.9 million. Of the sectors, Irrigated and Rain-fed Crops, and Urban Development and Municipal Services have the most needs, representing 43.2 percent and 25.9 percent of total needs, respectively. Some of the other sectors, ranked in terms of needs, are Water Supply and Sanitation (6 percent), and Transport (5.1 percent).

Figure 21: Distribution of South West State Needs

### DINA Field Visits and Consultations: Key Findings

The Ministry of Planning, Investment and Economic Development (MoPIED) and UN colleagues coordinated a field visit to Baidoa to undertake consultations with state-level line ministries, UN agencies operational in the state, and civil society representatives, regarding data collection, needs assessment and recovery strategies. Based on these consultations, the following sectors were identified as key priorities for recovery and resilience in Southwest State:

**Agriculture - Livestock:** Livestock replenishment and the construction of a livestock market is required.

**Water Supply and Sanitation:** Undertaking CFW schemes for the rehabilitation and construction of water points, birkets, and shallow wells is needed. Borehole drillings will also need to be undertaken throughout the state.

**Transport:** Undertaking CFW schemes for the rehabilitation and construction of town cobblestone roads and feeder roads should be focused on.

**Health:** Implementation of Integrated Community Care Management was identified as necessary to reduce infant and maternal mortality.

In terms of cross-cutting areas, livelihoods restoration support such as seed distribution and livelihoods diversification was identified as important interventions. Targeted support to IDPs in terms of support packages for the resettlement of this population was seen as necessary considering the large numbers of displaced due to the drought.
